About Data	European average data for PVC (e) production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data are probably fairly representative for production of PVC (e) in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages. Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO_2 emission. CO_2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO_2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).

Notes	The following substance names have been changed from the nomenclature used by APME to adapt to nomenclature according to CPM report 2000:2. RESOURCES Old name New name Barite (Ba(SO4) Barytes Bauxite (Al2O3*H2O) Bauxite Chromium (Cr3+, Cr6+) Chromium Coal, hard unspecified Hard coal Gravel (unspecified) Gravel Hydro (primary energy) Hydro energy Olivin (unspecified) Olivin Phosphate (as P2O5) Phosphate Potassium chloid Potassium chloride Sand (unspecified) Sand Sulphur (elemental) Sulphur Wood (unspecified) Wood EMISSIONS Old name New name Aluminium ion Al Ammonium ion NH4+ Carbon disulfide CS2 Carbonate CO32- Chlorine Cl2 Chromium oxide CrO3 Copper (Cu+) Cu Ethane, 1-,2-, chloro 1,2-Dichloroethane Fluorine (F2) F2 Hydrocyanic HCN Hydrogen H2 Iron, Fe2+, Fe3+ Fe Mercaptans Thiols Metals (unspecified) Metals Nickel ion (Ni++) Ni Nitrate (NO3) NO3- Oils (unspecified) Oil Organo-Cl Chloroorganics Other organics VOC Particulates (unspecified) Particles Sulfuric acid H2S4 Vinylchloride Vinyl chloride VOC (hydrocarbons) VOC VOC (hydrocarbons, oil) VOC VOC (unspecified origin) m.fl. SPINE LCI dataset: Production of polyvinyl chloride, suspension polymerised (APME)

Administrative	
Finished	Y
Date Completed	1999
Copyright	APME
Availability	Public

Technical System	
Name	Production of polyvinyl chloride, suspension polymerised (APME)
Functional Unit	1 kg of PVC (s)
Functional Unit Explanation	PVC (Poly Vinyl Chloride), is a chlorinated hydrocarbon polymer. The polymer is produced from vinyl chloride. Typical uses for suspension PVC: it is the general purpose grade and is used for most rigid PVC applications such as pipes, profiles and other building materials. It is also used for most flexible applications such as cable insulation, foils and various products made by

	injection moulding.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	The information given below comprises all available information in the datasheet from APME, from which this data set is acquired.. The PVC polymer is produced from vinyl chloride by a process where the double bond in the vinyl chloride is opened and neighbouring molecules combine with each other to produce a long chain molecule. The starting raw material for PVC are crude oil and natural gas for the hydrocarbon part of the molecule and naturally occuring sodium chloride (and to a lesser extent, potassium chloride) for the chlorine part. The hydrocarbon feedstocks are converted by cracking to ethylene (ethene). The sodium chloride is electrolysed as an aqueous solution to produce chlorine with sodium hydroxide and hydrogen as co-products. The ethylene and chlorine are reacted to produce 1,2-dichloroethane (ethylene dichloride) (reaction 1). The 1,2-dichloroethane is then decomposed by heating in a high temperature furnace (cracking) when it produces vinyl chloride and hydrogen chloride (reaction 2). If the process were stopped at this stage, it is clear that 50% of the input of chlorine would be lost from the system and, unless there were a sufficient demand for hydrogen chloride, this would represent a significant loss of raw materials. In practice, however, the hydrogen chloride from reaction (2) is reacted with further ethylene in the presence of oxygen (a reaction known as oxychlorination), to produce further 1,2-dichloroethane (reaction 3). The dichloroethane is now decomposed according to reaction (2). By matching the direct and oxychlorination steps, the overall reaction adds reaction (1), (2) and (3). The chlorine is now completely used by the overall process. For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded.

System Boundaries

Nature Boundary	''The data presented in the result tables are simply a listing of the data for which information is available''. Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have been estimated it instead. The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under the specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values. Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.
Time Boundary	Data refer to the year 1992-1993. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
Geographical Boundary	European average data. Data were supplied from 10 polyvinyl chloride producers in Belgium, France, Germany, Italy, Sweden, UK. For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For some intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production. The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.
Other Boundaries	This data set covers all operations up to the production of the polymer resin from raw materials in the earth but excludes any subsequent processes such as compounding, which are carried out prior to conversion. The following excluded subsystems are explicitly mentioned in the Methodology report: - External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste

	incineration, on the other hand, is included). - Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals. - Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0,01% to the totals. No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Metholodogy report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass. European average data. Data were supplied from 10 producers in Belgium, France, Germany, Italy, Sweden, UK. Their total production was 1,730,000 tonnes.
Allocations	In the Methodology report and the different ''Eco-profiles...'' reports, the following general co-product allocations are mentioned: - Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values. - Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis. - Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc. - Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g. sulphuric acid is used as a drying agent for chlorine, therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis. - Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process. - Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity. These allocations are general for data from APME, and only applicable for datasets where the above mentioned processes are included.
Systems Expansions	Not applied.

Flow Data

General Activity QMetaData

Date Conceived	1992-1993
Data Type	Derived, mixed
Represents	
Method	European average data. Results are based on data supplied by 10 production plants in 6 countries: Belgium, France, Germany, Italy, Sweden and UK. Their total production was 1,730,000 tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstram raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. Data from APMEs website www.lca.apme.org have been downloaded as exe-files. The files are opened and imported into Microsoft Excel. Further, the data from MS Excel is exported to a MS Access database.

About Inventory

Publication	''Eco-profiles of the European plastics industry'', report for PVC (s). ''Eco-profiles of plastics and related intermediates: Methodology'', I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME's web site http://lca.apme.org. -- Documented by Caroline Sjöberg and Sofia Haargaard, Volvo Technological Development Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology Published in SPINE@CPM: 5 September 2001 --
Intended User	1. APME member companies 2. L
General Purpose	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.
Detailed Purpose	Eco-profiles are intended primarily as buiding blocks for use in the construction of complete life cycle analyses. 1. Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2. Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products.

	Objectives and areas of application for the Eco-profiles: - Plastics waste management studies - Internal company benchmarking - Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems. - Ensuring that the data are neutral. The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occured since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.

Applicability	European average data. Data were supplied from 10 producers in Belgium, France, Germany, Italy, Sweden, UK. Their total production was 1,730,000 tonnes. The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows. Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful. It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.
About Data	European average data for PVC (s) production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data are probably fairly representative for production of PVC (s) in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages. Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. CO2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).

SPINE LCI dataset: Production of pork. ESA-DBP

Administrative	
Finished	Y
Date Completed	2005
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Production of pork. ESA-DBP
Functional Unit	1kg of pork
Functional Unit Explanation	
Process Type	Gate to gate
Site	Swedish Meats, Örebro, Sweden
Sector	Crop and animal production, hunting etc.
Owner	Swedish Meats, Örebro, Sweden

Technical system description	Excerpt from the report, see 'Publication': ''The Swedish meat consumption is quite constant, about 25 kg beef and 36 kg pork per capita each year. Domestic production accounts for 58% (139 million kg) and 79% (295 million kg) of the beef and pork production respectively. The company participating in the study, Swedish Meats, is one of the biggest food companies in Sweden, producing 58% of the slaughtered meat consumed. The company offers slaughtering and refining of beef, lamb and pork. The production of meat affects the environment in many ways. As for eutrofication and acidification, the largest contributor is the handling of manure; either in storage or as fertiliser in agriculture. Here ammonia in the form of emissions from manure and nitrogen leakage from crop cultivation are the most important substances, for acidification and eutrofication respectively. The cultivation of crop for use as fodder in the animal production affects the environment in other ways also, as an example the production of 1 kg of pork requires 11 m2 of land, out of which 9 m2 in Europe and 1.5 m2 in South America, the latter mainly for soy cultivation. This process is included in the system described in: Abelmann A. (2005). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf Other processes in the CPM Database also included in the above publication: - Sausage (Soy-Dog) production. ESA-DBP - Sausage (Pea-Dog) production. ESA-DBP - Sausage (Hot-Dog) production. ESA-DBP - Operation of 'Hot Dogs' producing facility. ESA-DBP - Pea cultivation. ESA-DBP - Production of beef. ESA-DBP - Rape seed cultivation. ESA-DBP - Wheat cultivation. ESA-DBP - Sugar beet cultivation. ESA-DBP - Soy bean processing. ESA-DBP - Soy bean cultivation. ESA-DBP

System Boundaries

Nature Boundary	Data include use of energy, as well as emissions to air and water.
Time Boundary	The data come from the report which was completed in 2002.
Geographical Boundary	Excerpt from the report, see 'Publication': ''Most ingredients in the two animal-based products originate from Sweden.
Other Boundaries	Excerpt from the report, see 'Publication': ''Not included are any aspects regarding personnel. (...) Some ingredients in the food processes have been judged to contribute very little to the overall process, and have therefore been excluded.''
Allocations	Excerpt from the report, see 'Publication': ''when allocation had to be used, an economic allocation approach was used''.
Systems Expansions	Not applicable

Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The overall aim of the study is to assess the potential environmental impacts of substituting animal protein for regionally grown vegetable protein in food products.''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The objective is to analyze three food products of the same type, and the purpose is to compare the environmental impact of the products and also to identify the most important contributors of the total environmental impact of each product. The products are described as follows. - a product in which all protein is animal protein. - a product in which 10% of the animal protein is replaced with vegetable protein. - a product in which all protein is vegetable protein. Furthermore, the objective is to provide useful information on the products that can be used in other environmental systems analysis, e.g. in meal studies.

SPINE LCI dataset: Production of primary copper

Administrative	
Finished	Y
Date Completed	1998
Copyright	The International Copper Association
Availability	Public

Technical System	
Name	Production of primary copper
Functional Unit	1 kg of pure copper
Functional Unit Explanation	The primary copper is leaving this system with 99.99% purity.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	Data received for this study are based on pyrometallurgical operations only. This activity includes: 1) Copper ore mining; 2) Copper ore concentrate preparation and delivery; 3) Production of matte copper; 4) Production of blister copper; 5) Production of copper anodes and 6) Production of primary copper. Production and use of electricity and fuel used in the processes are included. Below is a description of the included operations. -- 1) Ore mining -- The copper ore mining method used is determined by the size, shape and depth below the surface of the ore body. Most copper ores are mined by open pit mining in which large quarries are opened, the ore broken away from the deposits by use of explosives and shovelled into trucks. Actual energy requirements vary widely depending on the characteristics of the mine and ore handling techniques used. The type and the amount of ore deposit and the overlying rock and dirt and the depth of the seam below the surface, affect the level of energy needed for mining the ore. The data for copper mining have been received from three mining companies. The data cover the mining of 45 million tonnes of ore. -- 2) Ore concentrate preparation and delivery -- It is normal practice for mining companies to prepare or concentrate before shipping to reduce the amount of material to be transported. The data mainly relates to transportation of ore concentrate by rail and sea. Transporting the concentrate by sea is exstensive. It is assumed that average shipping and rail transport distances were 10 000 km and 500 km respectively. The data cover preparation of 2 million tonnes of concentrate

	-- 3) Production of matte copper -- Here the ore concentrate, mixed with flux and other additives, is charged in a fuelfired smelting furnace where it is melted. The molten mass is allowed to separate into two layers. The upper slag layer, made up of iron silicate with less than 0,5% of copper, is normally discarded. The lower matte layer, with about 40% to 75% of copper, and containing most of original metal present, is transferred to the converting step to produce blister copper. -- 4) Production of blister copper -- During the production of blister copper the matte is converted to blister in a converter by oxidation in two stages. In the first stage iron sulphide is oxidised and fluxed to form slag which may contain copper (1-5%). The converter slag is ususally recycled back to the smelting furnace. With all the iron removed, the remaining copper sulphide is further oxidised to blister copper. --5) Production of copper anodes -- The blister copper from the converter is transferred to anode furnace to reduce the residual sulphur as well as the oxygen levels in the metal. The data cover the production of 1 million tonnes of copper anodes. -- 6) Production of primary copper -- The metal at the anode stage still has some impurities (such as As, Bi, Ni, Pb and Sb) left along with precious metals (such as Ag, Au, Pt and Pd). These are separated from the copper by electro- refining into primary copper. The data covers the production of 900 000 tonnes of primary copper.

System Boundaries

Nature Boundary	Some of the data on air and water emissions was provided in a form which made it impractical to calculate emissions for unit mass of product output. For example, from an air emission value given in the units of mg/m3 of air, it is not possible to calculate the total emission unless the total volume of air is known and this is seldom measured in pactice.Therefor, where available, only emission values associated with the given amount of product made are used.
Time Boundary	The data comes from mining companies and producers of primary copper for the operations during the 12 month period in 1995 (information why the year 1995 was chosen is not available).
Geographical Boundary	The data comes mainly from European operations. Futher information of the geographical boundaries is not available.
Other Boundaries	The copper producing industry is international.
Allocations	The first thing that has been done to analyse this system is to break down the complex system into a series of separate sub-systems each of which produces a single product but which, when added together, exhibit the same charateristics as the original single system. In this study has co-product allocation and Stoichiometric allocation been applied. It is not often that practical processes exactly match for example the stoichiometric rules and an alternative method using mass must be applied.
Systems Expansions	Not applied

About Inventory	
Publication	Ecoprofile of Primary Copper Production- A report for The International Copper Association By Dr. I. Boustead. 1998. -- Data documented by: Sofia Medin, Electrolux ESD Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	LCA practitioners
General Purpose	The purpose of this work was to produce life-cycle inventory data for the production of primary copper based on data submitted by members of the International Copper Association from their own operations.
Detailed Purpose	The aim is to provide ''cradle to gate'' data for the production of primary copper.
Commissioner	- The International Copper Association .
Practitioner	Boustead, Ian Dr - .
Reviewer	
Applicability	There is no recommendation of how to use the data from this report. This activity is a ''cradle to gate'' system for primary copper production. In the sequence of operations leading up to primary copper production there are six main stages involved. These are 1) Copper ore mining; 2) Copper ore concentrate preparation and delivery; 3) Production of matte copper; 4) Production of blister copper; 5) Production of copper anodes and 6) Production of primary copper. All six stages in the primary copper production have been described cumulatively in separate activities in the database.
About Data	The data used for electricity and fuel production in the calculations leading to the results reported comes from the reports of International Energy Agency. Data Assumptions: Data received from participating companies show sometime wide variation with respect to metal contents of ore and various intermediate products such as concentrates, gas dust and scrap. Therefor has the following assumptions been made: 1. Copper content in ore. Where actual data on copper content of the ore were available these were used. Otherwise the content was calculated on the basis of mass flow. 2. Copper content of matte according to published literature is between 40% to 75%. The assumption made, where the copper content in matte was not derived from mass flow, is therefor 60 %. 3.Average copper content of blister was assumed to be 98,5%, based on published litterature. 4. Average copper content of copper anode was assumed to be 99.5% based om published literature. 5.Where the amount of SO2 gas is shown as one of the output products, it is regarded as 100 % pure. 6. There is also some loss of copper during ore preperation and the smelting and recovery processes. The loss can be calculated from the mass flow if accurate contents of the input and output materials where known.Where this is not possible, the loss is assumed to be 1% at each step of the sequence of operations. It is further assumed that there is another 4% loss of copper during the operational steps from ore preperation to electro-refining, making the total loss of copper to 5%.
Notes	The results in the report of the Ecoprofile study has been broken down into a number of categories, identifying the type of operation that gives rise to them. The categories are: 1. Fuel production 2. Fuel use 3. Process 4. Transport 5. Biomass (inputs and outputs associated with the use of biological materials such as wood)

SPINE LCI dataset: Production of PVC

Administrative	
Finished	Y
Date Completed	1996-03-01

Availability	Public

Technical System	
Name	Production of PVC
Functional Unit	ton
Functional Unit Explanation	1 ton produced PVC together with the by-products. The company also sell some biproducts, that are made in the PVC production. For each ton of PVC the biproducts sold are - 4,92 ton Caustic soda (NaOH) - 0,0310 ton Hydrchloric acid (30% HCl) - 1,15 ton 1,2-dichlore ethan
Process Type	Gate to gate
Site	Hydro Plast AB 444 83 Stenungsund Sweden
Sector	Materials and components
Owner	Hydro Plast AB 444 83 Stenungsund Sweden
Technical system description	Hydro Plast AB manufactures the plastic raw material polyvinyl chloride (PVC). The production includes preparation of chlore, VCM and PVC. The plant also has a sewage treatment works with biological filter and a filter-press for dewatering of sludge. The company also sell some by-products, that are made in the PVC-production. For each ton of PVC the by-products sold are - 4,92 ton Caustic soda (NaOH) - 0,0310 ton Hydrchloric acid (30% HCl) - 1,15 ton 1,2-dichlore ethan. Emissions to air are caused by shut-downs of the combustion oven at the VCM-factory. Continuous emission from the PVC-factory origines from drying of PVC and different point suction fans in the process. The discontinuous emission from the PVC-factory origines from disruption of the combustion oven when recycling VCM.

System Boundaries	
Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries	
Allocations

Flow Data
General Activity QMetaData

Date Conceived	1995
Data Type	Unspecified
Represents	See 'Function'
Method	Studying the Environmental report from Hydro Plast AB for 1995, The Board of County in Göteborg and Bohus Diffuse emissions Measurements of diffuse emissions to air from the plant as a hole has been done at 16 different places at the surrounding area of plant. A known volume of air has been pumped through a carbon tube, and then analyses has been done to measure the vinyl chloride, dichlore ethane, chloroform, carbon tetrachloride anad trichlore ethane contents with a gas cromatograph. Emitted amounts have then been calculated according to a model developed at the University of Uppsala. This so called fence model has during 1995 been modified from results given from measurements done at the hight of thirty meters. Recent measurements show that the mixing hight for gas is 44 meters.
Literature Reference	Eco- profiles of Primary Copper. A report for The International Copper Association, January 1998.
Notes	The emissions to air from the VCM-factory are caused by shut-downs of the combustion oven. The continuous emission from the PVC-factory origines from drying of PVC and different point suction fans in the process. The discontinuous emission from the PVC-factory origines from disruption of the combustion oven when recycling VCM. The method is mentioned on Specific QMetaData for a few emitted substances. The data type unspecified implies that one does not know the origin of the data.

About Inventory

Publication	Environmental report from Hydro Plast AB for 1995, The Board of County in Göteborg and Bohus -- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- The Environmental Administration in the municipality of Göteborg Box 360 401 25 Göteborg Sweden.
Practitioner	Andersson, Sam - Hydro Plast AB 444 83 Stenungsund Sweden.
Reviewer	- The Environmental Administration in the municipality of Göteborg Box 360 401 25 Göteborg Sweden

Applicability	The function of the technical system is not sufficently described. Contact the company to get the necessary details.
About Data	According to the numbering of the pages in the environmental report, two pages are missing. These two pagaes may contain information about used chemicals and/or hazardous waste. Contact the company for futher information.
Notes	The annual inspection of the plant is made by ÅF-IPK (Box 1551, 401 51 Göteborg, Sweden, Phone +46 -31 7431191, Fax +46 -31 7431191).

SPINE LCI dataset: Production of PVC calendered sheet (APME)

Administrative	
Finished	Y
Date Completed	1999
Copyright	APME
Availability	Public

Technical System	
Name	Production of PVC calendered sheet (APME)
Functional Unit	1 kg PVC calendered sheet
Functional Unit Explanation	A calender is a set of three or more heated rolls which convert high viscosity polymer resin into sheet. The sheet, in this case, is 300 mm made from PVC.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	The information given below comprises all available information in the datasheet from APME, from which this data set is acquired. The main groups of operations covered in the study are the production of the polymer resin, the transport of the resin to the converter, the conversion process itself and the packaging of the finished component for onward dispatch. Also, the production of fuels and energy used in the processes and transports are included. Polymer resins are delivered to converters either in bulk tankers or in plastic sacks. In this case it is assumed that all resin is delivered by bulk tanker, 20 tonne. The delivery distance is assumed to be 100 km one way. The bulk tanker must make an empty return and the fuel consumtion of an empty tanker is assumed to be 70% of that of a fully laden vehicle. Data for the conversion process have been obtained by four different factories operating in Germany, which produce 300 mm calendered PVC sheet. The data supplied covers all operations starting with PVC resin, and following all operations through mixing, preplastifying, calendering, pulling, cooling rolls, wind-up and packaging. All internal transport is also included. Polymer used in calendered sheet production contains 2.5-5% of additives (stabilisers, polymeric modifiers, slip agents and pigments). However, in this study these have all been treated as if they were OVC homopolymer. The conversion process: A calender is a set of three or more heated rolls which convert high viscosity polymer into sheet. The polymer passes between a sequence of heated rolls which control the feed rate, the thickness of the sheet and the surface finish. The polymer compound is, usually preheated, is fed through a pair of mixing rolls to ensure a uniform consistency. The polymer compound passes through a metal separation device to remove any accidental contamination before passing the calender itself. Once formed, the sheet is fed to cooling rolls and after passing through a thichness measurement operation is trimmed before being wound onto the final rolls. For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow

	with positiv sign. For ''Water Use'' the total amount has been recorded.

System Boundaries

Nature Boundary	The study take no account of any air emissions arising directly from the conversion process. While it is impossible to carry out such a process without generating some emissions, the quantities involved are thought to be very small and not significant compared with the burdens imported with the inputs to the system. ''The data presented in the result tables are simply a listing of the data for which information is available''. Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have been estimated it instead. The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under the specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values. Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.
Time Boundary	Data refer to the year 1995. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
Geographical Boundary	European average data. Results are based on data supplied by 4 producers of PVC calendered sheet in Germany. For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For some intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production. The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.
Other Boundaries	In practice the polymer used in calendered sheet production contains 2.5% to 5.0% additives. In this case the polymer is treated as if they were PVC homopolymer. The following excluded subsystems are explicitly mentioned in the Methodology report: - External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included). - Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals. - Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0,01% to the totals. No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Metholodogy report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass. European average data. Data were supplied from 4 PVC calendered sheet producers Germany. Their total production was not known, since the data supplied was normalized.
Allocations	In the Methodology report and the different ''Eco-profiles...'' reports, the following general co-product allocations are mentioned: - Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values. - Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis. - Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc. - Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g. sulphuric acid is used as a drying agent for chlorine, therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis. - Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce

	concentrated acid by removing water is attributed to the process. - Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity. These allocations are general for data from APME, and only applicable for datasets where the above mentioned processes are included.
Systems Expansions	Not applied.

Flow Data

General Activity QMetaData

Date Conceived	1995
Data Type	Derived, mixed
Represents	For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded. See Notes in Inventory for a list of how the nomenclature for substances used by APME have been translated into the nomenclature by CPM (CPM 2000:2). The Nomenclature for FlowTypes has in some cases been changed: Old name: Resources New name: Natural resource Old name: Waste New name: Residue Old name: Co-product New name: By-product Although the dataset contains a large number of decimals, which usually implies that there is a great accuracy in the data, we are somewhat questioning about this accuracy.
Method	European average data. Results are based on data supplied by 4 PVC celendered sheet production plants. The data was supplied as normalized data, therefore the production volume is not known. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emissions. For fuels and feedstock materials, actual gross calorific values (energy conten) have been used in teh calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. Data from APMEs website www.lca.apme.org have been downloaded as exe-files. The files are opened ind imported into Microsoft Excel. Further, the data from MS Excel is exported to a MS Access database.
Literature Reference	APME, Association of Plastics Manufacturers in Europe, website: http://lca.apme.org/reports /htm/alphabetical.htm
Notes	The emissions to air from the VCM-factory are caused by shut-downs of the combustion oven. The continuous emission from the PVC-factory origines from drying of PVC and different point suction fans in the process. The discontinuous emission from the PVC-factory origines from disruption of the combustion oven when recycling VCM. The method is mentioned on Specific QMetaData for a few emitted substances. The data type unspecified implies that one does not know the origin of the data.

About Inventory

Publication	''Eco-profiles of the European plastics industry'', report for PVC calendered sheet. ''Eco-profiles of plastics and related intermediates: Methodology'', I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME´s web site http://lca.apme.org. -- Documented by Sofia Boström, Volvo Technological Development Corporation Documentation reviewed by: Ann-Christin Pålsson, IMI, Chalmers University of Technology Published in SPINE@CPM: 24 May 2002 --
Intended User	1. LCA practitioners in genera
General Purpose	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from production of the polymer resin to the finished PVC sheet.
Detailed Purpose	Eco-profiles are intended primarily as buiding blocks for use in the construction of complete life cycle analyses. 1. Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2. Provide valuable inventory data for downstream users of PVC clendered sheets, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products. Objectives and areas of application for the Eco-profiles: -Plastic waste management stidues - Internal company benchmarking - Product development. Detailed environmental information to customers of APME memebers for use in improving the overall environmental performance of products and systems. - Ensuring that the data are neutral.

	The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occured since 1989-1993, the period to which the oldest group of Eco-profiles data referred. Also the quality of data reported by the companies has improved since then.
Commissioner	APME - .
Practitioner	Ian Boustedt - .
Reviewer	
Applicability	European average data. Data were supplied from 4 PVC calendered sheet producers in Germany. Their total production was not known, since the data supplied was normalized. The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows. Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful. It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.
About Data	European average data for PVC calendered sheet production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data are probably fairly representative for production of PVC calendered sheet in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages. Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO_2 emission. CO_2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO_2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).

SPINE LCI dataset: Production of PVC injection moulding (APME)

Administrative	
Finished	Y
Date Completed	1999
Copyright	APME
Availability	Public

Technical System	
Name	Production of PVC injection moulding (APME)
Functional Unit	1 kg saleable PVC mouldings
Functional Unit Explanation	Injection moulding is one of the most widely used polymer conversion processes, and is capable of producing almost any component. In this case, PVC is the polymer resin used as rawmaterial.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	The information given below comprises all available information in the datasheet from APME, from which this data set is aqcuired. The main groups of operations covered in the study are the production of the polymer resin, the transport of the resin to the converter, the conversion process itself and the packaging of the finished component for onward dispatch. Also, the production of fuels and energy used in the processes and transports are included.

	Polymer resins are delivered to converters either in bulk tankers or in plastic sacks. In this case it is assumed that all resin is delivered by bulk tanker, 20 tonne. The delivery distance is assumed to be 100 km one way. The bulk tanker must make an empty return and the fuel consumtion of an ampty tanker is assumed to be 70% of that of a fully laden vehicle. Data for the conversion process have been obtained by two factories in France which between them produces over 9000 tonne of PVC fittings for drainage pipe systems. The data includes all operations associated with compounding, injection moulding, storage, warehousing, heating and internal transport. Fillers, stabilisers, lubricants and pigments have been treated as if they were PVC homopolymer. The data also include in-house scrap which is ground and reused. On average the process produces 0.7% unusable polymer waste but all other scrap is recycled internally. There is, in addition, a small production of landfilled other waste (2.8 g per kg product) and some regulated waste (0.1 g per kg product). Water emissions are monitored and show a COD of 28 mg per kg product and suspended solids of 20 mg per kg product. These have been included in the calculations. The conversion process: Injection moulding is one of the most widely used polymer conversion processes and is capable of producing almost any component. In injection moulding, the polymer resin together with any additives are heated until molten and injected into a water sooled mould. Once solid, the mould is opened and the component ejected. The cycle is then repeated.Irrespective of the type of machinery used, the sequence of events in the injection moulding process can be represented as a time cycle. The four elements of the cycle are: 1) Injection time - the time taken to fill the mould with the molten polymer. 2) Dwell time - the time period during which the mould is full but remains under pressure. 3) Freeze time - the time required for the moulding to set sufficiently to allow the moulding to be removed without damage. 4) Dead time - the time required for the mould to open, for moulding to be removed and for the mould to close again. For raw materials, inputs as listed from APME, have been reocorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded.

System Boundaries

Nature Boundary	The study take no account of any air emissions arising directly from the conversion process. While it is impossible to carry out such a process without generating some emissions, the quantities involved are thought to be very small and not significant compared with the burdens imported with the inputs to the system. ''The data presented in the result tables are simply a listing of the data for which information is available''. Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have been estimated it instead. The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under the specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values. Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.
Time Boundary	Data refer to the year 1995. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older. The total produciton was 9 000 tonnes.
Geographical Boundary	European indicative values. Results are based on data supplied by 2 producers of PVC mouldings in France. For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For some intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production. The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.
Other Boundaries	Fillers, lubricants, stabilisers and pigments have all been treated as if they were homopolymers. The following excluded subsystems are explicitly mentioned in the Methodology report: - External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included).

	- Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals. - Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0,01% to the totals. No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Metholodogy report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass. Results are based on data supplied by 2 PVC injection moulding production plants in France. Their total production was 9000 tonnes.
Allocations	In the Methodology report and the different ''Eco-profiles...'' reports, the following general co-product allocations are mentioned: - Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values. - Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis. - Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc. - Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g. sulphuric acid is used as a drying agent for chlorine, therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis. - Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process. - Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity. These allocations are general for data from APME, and only applicable for datasets where the above mentioned processes are included.
Systems Expansions	Not applied.

Flow Data

General Activity QMetaData

Date Conceived	1995
Data Type	Derived, mixed
Represents	For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded. See Notes in Inventory for a list of how the nomenclature for substances used by APME have been translated into the nomenclature by CPM (CPM 2000:2). The Nomenclature for FlowTypes has in some cases been changed: Old name: Resources New name: Natural resource Old name: Waste New name: Residue Old name: Co-product New name: By-product Although the dataset contains a large number of decimals, which usually implies that there is a great accuracy in the data, we are somewhat questioning about this accuracy.
Method	European average data. Results are based on data supplied by 2 PVC injection moulding production plants in France. Their total production wasn 9000 tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied whereever there have been sufficient data from upstream raw material and fuel producers. In verticall averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the caluclations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO_2 emissions. For fuels and feedstock materials, actual gross calorific values (energy conten) have been used in teh calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. Data from APMEs website www.lca.apme.org have been downloaded as exe-files. The files are opened ind imported into Microsoft Excel.

	Further, the data from MS Excel is exported to a MS Access database.
Literature Reference	APME, Association of Plastics Manufacturers in Europe, website: http://lca.apme.org/reports/htm/alphabetical.htm
Notes	The emissions to air from the VCM-factory are caused by shut-downs of the combustion oven. The continuous emission from the PVC-factory origines from drying of PVC and different point suction fans in the process. The discontinuous emission from the PVC-factory origines from disruption of the combustion oven when recycling VCM. The method is mentioned on Specific QMetaData for a few emitted substances. The data type unspecified implies that one does not know the origin of the data.

About Inventory

Publication	''Eco-profiles of the European plastics industry'', report for PVC moulding. ''Eco-profiles of plastics and related intermediates: Methodology'', I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME´s web site http://lca.apme.org. Documented by Sofia Boström, Volvo Technological Development Corporation
Intended User	1. LCA practioners in general
General Purpose	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from production of the polymer resin to the finished PVC moulding.
Detailed Purpose	Eco-profiles are intended primarily as buiding blocks for use in the construction of complete life cycle analyses. 1. Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2. Provide valuable inventory data for downstream users of PVC mouldings, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products. Objectives and areas of application for the Eco-profiles: -Plastic waste management stidues - Internal company benchmarking - Product development. Detailed environmental information to customers of APME memebers for use in improving the overall environmental performance of products and systems. - Ensuring that the data are neutral. The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occured since 1989-1993, the period to which the oldest group of Eco-profiles data referred. Also the quality of data reported by the companies has improved since then.

Reviewer	
Applicability	This data set provides indicative values for PVC injection moulding in Europe. It is important to recognise that the performance of injection moulding factories can be very variable because of factors such as rate of injection (kg/hour) , the design and age of the moulding machines, the general level of activity in the factory and the duration of a production sequence. As a consequence it is almost impossible to produce typical, representative figures for performance. Data were supplied by 2 PVC injection moulding producers in France. Their total production was 9000 tonnes. The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows. Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful. It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.
About Data	European indicative values for PVC injection moulding production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. The reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages. Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data

	have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. CO2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).

SPINE LCI dataset: Production of PVC pipe (APME)

Administrative	
Finished	Y
Date Completed	1999
Copyright	APME
Availability	Public

Technical System	
Name	Production of PVC pipe (APME)
Functional Unit	1 kg extruded PVC pipe
Functional Unit Explanation	In pipe extrusion the molten polymer is extruded through an annular die and cooled by passing through a water trough. The polymer used as raw material is in this case PVC.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	The information given below comprises all available information in the datasheet from APME, from which this data set is aqcuired. The main groups of operations covered in the study are the production of the polymer resin, the transport of the resin to the converter, the conversion process itself and the packaging of the finished component for onward dispatch. Also, the production of fuels and energy used in the processes and transports are included. Polymer resins are delivered to converters either in bulk tankers or in plastic sacks. In this case it is assumed that all resin is delivered by bulk tanker, 20 tonne. The delivery distance is assumed to be 100 km one way. The bulk tanker must make an empty return and the fuel consumtion of an ampty tanker is assumed to be 70% of that of a fully laden vehicle. In pipe extrusion the molten polymer is extruded through an annular die and cooled by passing through a water trough. Data for the conversion process have been obtained by three factories operating in the Netherlands. The effects of stabilisers have been ignored so that in the calculations all of the weight of the pipe is assumed to be PVC homopolymer. For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded.

System Boundaries	
Nature Boundary	The study take no account of any air emissions arising directly from the conversion process. While it is impossible to carry out such a process without generating some emissions, the quantities involved are thought to be very small and not significant compared with the burdens imported with the inputs to the system. ''The data presented in the result tables are simply a listing of the data for which information is available''. Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have been estimated it instead. The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under the specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values. Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.

Time Boundary	Data refer to the year 1995. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
Geographical Boundary	European average data. Results are based on data supplied by 3 producers of PVC pipe in the Netherlands. For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For some intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production. The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.
Other Boundaries	The effect of stabilisers have been ignored so that in the calculations all of the weight of the pipe is assumed to be PVC homopolymer. The following excluded subsystems are explicitly mentioned in the Methodology report: - External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included). - Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals. - Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0,01% to the totals. No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Metholodogy report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass. European average data. Data were supplied from 3 PVC pipe producers in the Netherlands. Their total production was 60 000 tonnes.
Allocations	In the Methodology report and the different ''Eco-profiles...'' reports, the following general co-product allocations are mentioned: - Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values. - Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis. - Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc. - Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g. sulphuric acid is used as a drying agent for chlorine, therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis. - Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process. - Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity. These allocations are general for data from APME, and only applicable for datasets where the above mentioned processes are included.
Systems Expansions	Not applied.

Data Type	Derived, mixed
Represents	For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded. See Notes in Inventory for a list of how the nomenclature for substances used by APME have been

	translated into the nomenclature by CPM (CPM 2000:2). The Nomenclature for FlowTypes has in some cases been changed: Old name: Resources New name: Natural resource Old name: Waste New name: Residue Old name: Co-product New name: By-product Although the dataset contains a large number of decimals, which usually implies that there is a great accuracy in the data, we are somewhat questioning about this accuracy.
Method	European average data. Results are based on data supplied by 3 PVC pipe production plants i the Netherlands. Their total production was 60 000 tonnes.
Literature Reference	APME, Association of Plastics Manufacturers in Europe, website: http://lca.apme.org/reports/htm/alphabetical.htm
Notes	The emissions to air from the VCM-factory are caused by shut-downs of the combustion oven. The continuous emission from the PVC-factory origines from drying of PVC and different point suction fans in the process. The discontinuous emission from the PVC-factory origines from disruption of the combustion oven when recycling VCM. The method is mentioned on Specific QMetaData for a few emitted substances. The data type unspecified implies that one does not know the origin of the data.

About Inventory

Publication	''Eco-profiles of the European plastics industry'', report for PVC pipe. ''Eco-profiles of plastics and related intermediates: Methodology'', I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME´s web site http://lca.apme.org. -- Documented by Sofia Boström, Volvo Technological Development Corporation Documentation reviewed by: Ann-Christin Pålsson, IMI, Chalmers University of Technology Published in SPINE@CPM: 24 May 2002 --
Intended User	1. LCA practitioners in genera
General Purpose	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from production of the polymer resin to the finished PVC pipe.
Detailed Purpose	Eco-profiles are intended primarily as buiding blocks for use in the construction of complete life cycle analyses. 1. Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2. Provide valuable inventory data for downstream users of PVC pipe, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products. Objectives and areas of application for the Eco-profiles: -Plastic waste management stidues - Internal company benchmarking - Product development. Detailed environmental information to customers of APME memebers for use in improving the overall environmental performance of products and systems. - Ensuring that the data are neutral. The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occured since 1989-1993, the period to which the oldest group of Eco-profiles data referred. Also the quality of data reported by the companies has improved since then.
Commissioner	APME - .
Practitioner	Ian Boustedt - .
Reviewer	
Applicability	European average data. Data were supplied from 3 PVC pipe producers in the Netherlands. Their total production was 60 000 tonnes. The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows. Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful. It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.
About Data	European average data for PVC pipe production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data are probably fairly representative for production of PVC pipe in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages.

	Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO_2 emission. CO_2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO_2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).

SPINE LCI dataset: Production of PVC unplasticised film APME

Administrative	
Finished	Y
Date Completed	1999
Copyright	APME
Availability	Public

Technical System	
Name	Production of PVC unplasticised film APME
Functional Unit	1 kg Unplasticised PVC film
Functional Unit Explanation	In the process for producing film the polymer resin is extruded as a continuous tube to form a thin film. In this case the polymer used as raw material is PVC.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	The information given below comprises all available information in the datasheet from APME, from which this data set is aqcuired. The main groups of operations covered in the study are the production of the polymer resin, the transport of the resin to the converter, the conversion process itself and the packaging of the finished component for onward dispatch. Also, the production of fuels and energy used in the processes and transports are included. Polymer resins are delivered to converters either in bulk tankers or in plastic sacks. In this case it is assumed that all resin is delivered by bulk tanker, 20 tonne. The delivery distance is assumed to be 100 km one way. The bulk tanker must make an empty return and the fuel consumtion of an ampty tanker is assumed to be 70% of that of a fully laden vehicle. The data have been obtained for the production of 10 000 tonne of unplasticised PVC (UPVC) film which is produced by four factories in Germany. The UPVC film is produced in a manner similar to that for low density PE film. The following description of the process is obtained from the Ecoprofiles report for LDPE film production. The conversion process: Molten polymer is extruded as a continuous tube. As it leaves the extrusion die, the tube is inflated with air to form a bubble and when the bubble reaches the appropriate size it tis cooled by air which changes it into a solid film. The region where the solodification occurs, known as the ''frost line'', is the region where the required film gauge (or thickness) is reached. The tube is then guided by collapsing boards to be gradually flattened as it approaches the pinch rolls. When the lay-flat film passes between them, the top of the bubble is effectively sealed. The seal is entirely dependent upon the nip pressures since the two plastic surfaces do not stick together. The lay-flat tubing is fed to the winding equipment via a pre-treatment and slitting unit. Slitting and trimming is a continuous cutting operation. Finally, the finished film is packaged for despatch. For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded.

System Boundaries	
Nature Boundary	The study take no account of any air emissions arising directly from the conversion process. While it is impossible to carry out such a process without generating some emissions, the quantities involved are thought to be very small and not significant compared with the burdens imported with the inputs to the system.

	''The data presented in the result tables are simply a listing of the data for which information is available''. Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have been estimated it instead. The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under the specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values. Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.
Time Boundary	Data refer to the year 1995. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
Geographical Boundary	European average data. Results are based on data supplied by 4 producers of unplasticised PVC film in Germany. For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For some intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production. The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.
Other Boundaries	The following excluded subsystems are explicitly mentioned in the Methodology report: - External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included). - Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals. - Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0,01% to the totals. No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Metholodogy report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass. European average data. Data were supplied from 4 unplasticised film producers Germany. Their total production was 10 000 tonnes.
Allocations	In the Methodology report and the different ''Eco-profiles...'' reports, the following general co-product allocations are mentioned: - Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values. - Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis. - Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc. - Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g. sulphuric acid is used as a drying agent for chlorine, therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis. - Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process. - Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity. These allocations are general for data from APME, and only applicable for datasets where the above mentioned processes are included.
Systems Expansions	Not applied.

Flow Data

General Activity QMetaData

Date Conceived	1995
Data Type	Derived, mixed
Represents	For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded. See Notes in Inventory for a list of how the nomenclature for substances used by APME have been translated into the nomenclature by CPM (CPM 2000:2). The Nomenclature for FlowTypes has in some cases been changed: Old name: Resources New name: Natural resource Old name: Waste New name: Residue Old name: Co-product New name: By-product Although the dataset contains a large number of decimals, which usually implies that there is a great accuracy in the data, we are somewhat questioning about this accuracy.
Method	European average data. Results are based on data supplied by 4 PVC unplasticised film production plants in Germany. Their total production was 10 000 tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied whereever there have been sufficient data from upstream raw material and fuel producers. In verticall averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the caluclations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emissions. For fuels and feedstock materials, actual gross calorific values (energy conten) have been used in teh calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. Data from APMEs website www.lca.apme.org have been downloaded as exe-files. The files are opened ind imported into Microsoft Excel. Further, the data from MS Excel is exported to a MS Access database.
Literature Reference	APME, Association of Plastics Manufacturers in Europe, website: http://lca.apme.org/reports /htm/alphabetical.htm
Notes	The emissions to air from the VCM-factory are caused by shut-downs of the combustion oven. The continuous emission from the PVC-factory origines from drying of PVC and different point suction fans in the process. The discontinuous emission from the PVC-factory origines from disruption of the combustion oven when recycling VCM. The method is mentioned on Specific QMetaData for a few emitted substances. The data type unspecified implies that one does not know the origin of the data.

About Inventory

Publication	''Eco-profiles of the European plastics industry'', report for PVC unplasticised film. ''Eco-profiles of plastics and related intermediates: Methodology'', I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME´s web site http://lca.apme.org. -- Documented by Sofia Boström, Volvo Technological Development Corporation Documentation reviewed by: Ann-Christin Pålsson, IMI, Chalmers University of Technology Published in SPINE@CPM: 24 May 2002 --
Intended User	1. LCA practitioners in genera
General Purpose	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from production of the polymer resin to the finished UPVC film.
Detailed Purpose	Eco-profiles are intended primarily as buiding blocks for use in the construction of complete life cycle analyses. 1. Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2. Provide valuable inventory data for downstream users of UPVC film, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products. Objectives and areas of application for the Eco-profiles: -Plastic waste management stidues - Internal company benchmarking - Product development. Detailed environmental information to customers of APME memebers for use in improving the overall environmental performance of products and systems. - Ensuring that the data are neutral. The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occured since 1989-1993, the period to which the oldest group of Eco-profiles data referred. Also the quality of data reported by the companies has improved since then.

Commissioner	APME - .
Practitioner	Ian Boustedt - .
Reviewer	
Applicability	European average data. Data were supplied from 4 PVC unplasticised film producers in Germany. Their total production was 10 000 tonnes. The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows. Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful. It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.
About Data	European average data for PVC unplasticised film production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data are probably fairly representative for production of PVC unplasticised film in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages. Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. CO2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).
Notes	The following substance names have been changed from the nomenclature used by APME to adapt to nomenclature according to CPM report 2000:2. SPINE LCI dataset: Production of quartz sand

Administrative	
Finished	Y
Date Completed	02-12-31
Copyright	
Availability	Public

Technical System	
Name	Production of quartz sand
Functional Unit	0,675 kg sand
Functional Unit Explanation	0,675 kg sand is used for the sand form in the casting process for producing one bearing housing, SNL 511-609, at SKF Mekan AB in Katrineholm. Since the sand is needed (and bought from the same sand pit) also for the sand form in the casting process for guide rings, the same dataset is used. The dataset is used unchanged for our specific case, and thus the functional unit is 0,675 kg sand. The figure 0,675 has nothing to do with guide rings as such.
Process Type	Gate to gate
Site	Broby
Sector	Other mining
Owner	Broby
Technical system description	This activity describes a process step included in the whole system activity ''Production of guide rings used for spherical roller bearings''', also available in the SPINE@CPM database. The guide ring is manufactured at SKF Mekan AB in Katrineholm and the process consists of several steps. See the activity ''Production of guide rings used for spherical roller bearings'' for details. The guide ring will finally be mounted into the SKF Spherical Roller Bearing 232/530. The function of the guide ring is to assure that the rollers stay in the raceways of the bearing.

	Production of quartz sand: The quartz sand used for the sand form in the casting process at SKF Mekan AB in Katrineholm come from a sand pit in Broby, Sweden. Digging machines are used in the sand pit, and these are consuming diesel. The sand is dried to lower the moisture content and in the drying process, fuel oil is used. The production of electricity, diesel and heavy fuel oil are NOT included in this dataset and must be taken into account to obtain a total environmental impact. The combustion of diesel and heavy fuel oil are NOT included in this dataset and must be taken into account to obtain a total environmental impact.

System Boundaries

Nature Boundary	No emissions to air and water are known.
Time Boundary	The data was collected during the autumn 2002 and no changes in the procedure are planned for the nearest future.
Geographical Boundary	The process takes place in Broby, Sweden
Other Boundaries	The production of electricity, diesel and heavy fuel oil are NOT included in this dataset and must be taken into account to obtain a total environmental impact. The combustion of diesel and heavy fuel oil are NOT included in this dataset and must be taken into account to obtain a total environmental impact.
Allocations	Allocations were made according to weight.
Systems Expansions	Not applicable

Flow Data

General Activity QMetaData

Date Conceived	02-08-01 - 02-12-31
Data Type	Derived, mixed
Represents	For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded. See Notes in Inventory for a list of how the nomenclature for substances used by APME have been translated into the nomenclature by CPM (CPM 2000:2). The Nomenclature for FlowTypes has in some cases been changed: Old name: Resources New name: Natural resource Old name: Waste New name: Residue Old name: Co-product New name: By-product Although the dataset contains a large number of decimals, which usually implies that there is a great accuracy in the data, we are somewhat questioning about this accuracy.
Method	Data is taken from an earlier LCA study of the bearing housing SNL 511-609: Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmars University; August 2002.
Literature Reference	Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmars University; August 2002.
Notes	The emissions to air from the VCM-factory are caused by shut-downs of the combustion oven. The continuous emission from the PVC-factory origines from drying of PVC and different point suction fans in the process. The discontinuous emission from the PVC-factory origines from disruption of the combustion oven when recycling VCM. The method is mentioned on Specific QMetaData for a few emitted substances. The data type unspecified implies that one does not know the origin of the data.

About Inventory

Publication	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ----------- Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.

Intended User	Product developers at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.

Reviewer	Olle Ramnäs -
Applicability	The data set is applicable for sand digging and drying at the specific site in Broby, Sweden.
About Data	Data is taken from an earlier LCA study of the bearing housing SNL 511-609: Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmars University; August 2002.
Notes	

SPINE LCI dataset: Production of rolled aluminium sheet

Administrative	
Finished	Y
Date Completed	2002-05-07
Copyright	EAA
Availability	Public

Technical System	
Name	Production of rolled aluminium sheet
Functional Unit	1000 kg rolled aluminium sheet
Functional Unit Explanation	Typical delivered condition of rolled aluminium sheet: - surface mill-finish - without lubrication/foil cadding/intermediate paper - wooden EURO-pallets, sheets wrapped in PE foil, steel bands
Process Type	Gate to gate
Site	Not specified. See Geographical boundaries for further information.
Sector	Materials and components
Owner	Not specified. See Geographical boundaries for further information.
Technical system description	The inventory data cover rolled aluminium sheet production, e.g. sheet used in Europe for the outer parts of cars in the following typical delivered condition: - surface mill-finish - without lubrication/foil cadding/intermediate paper - wooden EURO-pallets, sheets wrapped in PE foil, steel bands The internal recycling of process scrap during sheet production is included. --- The starting material for the production of rolled aluminium sheet is aluminium slab (rolling ingot) with alloy properties tailored to final use weighting up to 25 tinnes, and of a thickness of 500-700 mm. In this documentation form the starting material is referred to as ''aluminium ingot'' when it comes from an external primary aluminium or secondary aluminium plant. The starting material aluminium slab is also produced by remelting process scrap (Ingot remelting and casting) and this input is referred to as ''casting scrap''. The aluminium ingot and casting scrap goes to the first process step ''Sawing and scalping''. After heating the aluminium slab to around 500 degrees Celsius, it is hot rolled, typically to

	2-5 mm thickness, followed by cold rolling to the final gauge. An alternative production route, starting with continuous cast strip, is not considered here. The process steps are: - Production of semi-finished aluminium - 1. Sawing and scalping 2. Hot rolling 3. Cold rolling 4. Solution heat treatment 5. Finishing 6. Packaging - Recycling of process scrap - 7. Ingot remelting and casting Production of electricity is included in the system. Some further details on the recycling of process scrap is given below. From the process steps Sawing and scalping (154 kg), Hot rolling (139 kg), Cold rolling (73 kg), and Finishing (110 kg) scrap is going to the process step Ingot remelting and casting. The values in brackets is the amount of scrap delivered from each process step. 21 kg scrap is recycled within the process ingot remelting and casting.

System Boundaries

Nature Boundary	--- BOUNDARIES VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- Cut-off criteria through out this inventory is basically relevance, as checked by the industry expert team monitoring the work and confirmed by reviewer I. Boustead. As a rough guideline ''less than 1% of total mass'' is applied for the inputs, i.e if the input is less than 1% of the total mass, then it is not included in the inventory table. The base for the choices of included inventory parameters is not further described in the EAA report.
Time Boundary	--- BOUNDARIES VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- The data derived from an industry survey from 1998 and includes literature data from reports dated 1998 and 1999.
Geographical Boundary	--- BOUNDARIES VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- It is not always explicit in the report where the different included process steps take place. Data may be acquired from outside of Europe, e.g. regarding ancillary materials. See litterature references (LitteratureRef) next to the flow table (FlowMetaData) for further information about the data sources for each process step.
Other Boundaries	See Nature boundaries for a specification of the cut-off criteria that has been applied.
Allocations	Allocations are not explicitly specified in the Environmental Profile Report 2000.
Systems Expansions	System expansions are not explicitly specified in the Environmental Profile Report 2000.

Flow Data

General Activity QMetaData

Date Conceived	1998
Data Type	Derived, unspecified
Represents	Not relevant.
Method	PRODUCTION OF SEMI-FINISHED ALUMINIUM The data derive from an industry survey with a coverage ranging from 20% to 70%, depending on the product in question. INGOT REMELTING AND CASTING (RECYCLING OF PROCESS SCRAP) Data were obtained from aluminium-integrated cast house operations, i.e. cast houses associated with semi-finished aluminium production. The 1998 survey on semi-finished aluminium products also encompassed aluminium-integrated cast houses, with 37% coverage for the recycling of process scrap. TRANSPORTS Transport energy and air emission data have been taken from SAEFL Environmental Series 250 (1998) ''BUWAL 250'', table 16.9 ELECTRICITY For all manufacturing operations, the consumption of fossil fuels and emissions linked to electricity production was calculated according to the UCTPE 94 electrical energy model as described in BUWAL 250. Emissions from combustion only, i.e. without the precombustion contribution, have been considered where appropriate in order to make a direct comparision with the corresponding process emissions. Emission data for combustion came from a report prepared by EMPA for EEA (13 December 1997), showing the respective contributions of precombustion and combustion in 'BUWAL 250, table 16.9'. Although emissions from fuel combustion were often covered in the industry survey reporting, data calculated from BUWAL 250 were always used, inview of the fact that the survey results were not sufficiently reliable due to inconsistent use of conversion factors.

Literature Reference	---Rolled sheet production and process scrap recycling Industry survey from 1998 ---Transport energy, electricity, and air emission - SAEFL Environmental Series 250 (1998) ''BUWAL 250'', table 16.9 - EMPA report for EAA dated 27 April 1998, derived from Buwal 250 for national grid systems.
Notes	In this inventory profile it is possible to identify which process step (Rolled sheet production, Process scrap recycling) the flow is connected to and if it derives from the energy use, see Note-field for each specific flow. However, in order to get the numerical data devided on these two process steps, see Environmental Profile Report (EAA, 2000).

Notes: This substance is connected both to the rolled sheet production and the process scrap recycling.	Input	Natural resource	Brown coal	75.7			kg	Ground	
Notes: This substance is connected both to the rolled sheet production and the process scrap recycling.	Input	Natural resource	Crude oil	21.0			kg	Ground	
Notes: This substance is connected both to the rolled sheet production and the process scrap recycling.	Input	Natural resource	Hard coal	71.9			kg	Ground	
Notes: This substance is connected both to the rolled sheet production and the process scrap recycling.	Input	Natural resource	Natural gas	99.3			kg	Ground	
Notes: 6,12 kg is alloying additives as master alloys and 6,83 kg in pure form. This substance is connected to the process scrap recycling.	Input	Refined resource	Alloying additives	12.95			kg	Technosphere	
	Input	Refined resource	Aluminium ingot	1012			kg	Technosphere	
Notes: This substance is connected to the process scrap recycling.	Input	Refined resource	Ar-gas	0.91			kg	Technosphere	
Notes: This substance is connected to the process scrap recycling.	Input	Refined resource	Chlorine	0.008			kg	Technosphere	
Notes: Includes electricity produced by nuclear and hydro power plants (nuclear 251 kWh and hydro 102 kWh). This substance is connected both to the rolled sheet production and the process scrap recycling.	Input	Refined resource	Electricity	353			kWh	Technosphere	
Notes: Fluxing agents are salts. This substance is connected to the process scrap recycling.	Input	Refined resource	Fluxing agents	0.38			kg	Technosphere	
Notes: This substance is connected to the process scrap recycling.	Input	Refined resource	Nitrogen	0.40			kg	Technosphere	
Notes: The paper and cardboard is used for packaging. This substance is connected to the rolled sheet production.	Input	Refined resource	Paper and cardboard	0.10			kg	Technosphere	
Notes: The plastics is used for packaging. This substance is connected to the rolled sheet production.	Input	Refined resource	Plastics	0.40			kg	Technosphere	
Notes: This substance is connected to the process scrap recycling.	Input	Refined resource	Refractory materials	0.50			kg	Technosphere	
Notes: This substance is connected to the rolled sheet production.	Input	Refined resource	Rolling oil	3.8			kg	Technosphere	
Notes: Steel is used for packaging. This substance is connected to the rolled sheet production.	Input	Refined resource	Steel	0.50			kg	Technosphere	
Notes: Water is used for cooling. This substance is connected both to the rolled sheet production and the process scrap recycling.	Input	Refined resource	Water	42			m3	Technosphere	
Notes: Wood is used for packaging. This substance is connected to the rolled sheet production.	Input	Refined resource	Wood	0.10			kg	Technosphere	
Notes: Aluminium skimmings for recycling.	Output	By-product	Aluminium skimmings	16.0			kg	Technosphere	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	CH4	1.3			kg	Air	
Notes: This emission derives from the process scrap recycling.	Output	Emission	Chlorides	0.0016			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	Chlorides	1.3			kg	Water	

Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	CO	0.15			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	CO2	499			kg	Air	
Notes: This emission derives from the rolled sheet production.	Output	Emission	COD	0.079			kg	Water	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	Dust	0.33			kg	Air	
Notes: HC, other than CH4. This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	HC	0.40			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is partly connected to the energy use.	Output	Emission	HCl	0.059			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	HF	0.0048			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	NH3	0.00077			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	NOx	0.81			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	Oil/grease	0.033			kg	Water	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	SO2	1.56			kg	Air	
Notes: This emission derives both from the rolled sheet production and the process scrap recycling. It is connected to the energy use.	Output	Emission	Suspended particles	0.20			kg	Water	
Notes: This emission derives from the rolled sheet production.	Output	Emission	VOC	0.44			kg	Air	
	Output	Product	Rolled aluminium sheet	1000			kg	Technosphere	
Notes: This residue derives from the rolled sheet production.	Output	Residue	Hazardous waste	4.8			kg	Technosphere	
Notes: The oil is reprocessed or burnt. This residue derives from the rolled sheet production.	Output	Residue	Oil	2.3			kg	Technosphere	
Notes: This residue derives both from the rolled sheet production and the process scrap recycling.	Output	Residue	Solid waste unspecified	7.1			kg	Technosphere	

About Inventory

Publication	Environmental Profile Report for the European Aluminium Industry, European Aluminium Association, April 2000 -- Data documented by: Maria Erixon, IMI, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, IMI, Chalmers University of Technology Published in SPINE@CPM: 8 May 2002 --
Intended User	LCA-practitioners.
General Purpose	The European Aluminium Association (EAA) aims to contribute to further environmental improvements in aluminium products in a life cycle concept.

Detailed Purpose	To provide LCA-practitioners with detailed and up-to-date information representing the aluminium The purpose with the Environmental Profile Report 2000 is to provide LCA-practitioners with detailed and up-to-date information representing the aluminium industry activities in Europe. The purposes with formatting the Environmental Profile Report 2000 for the European Aluminium Industry to the data documentation format SPINE, according to the data documentation criteria applied at Centre for environmental assessment of Product and Material systems (CPM) are: - CPM and European Aluminium Association (EAA) are anxious to provide life cycle assessment (LCA) practitioners with accurate and up to date environmental data for aluminium production. - EAA is interested in the SPINE formatting procedure and result, as the format is a base for (and therefor somewhat similar to) the new Technical Specification in ISO, ISO 14048, regarding LCA data documentation format. - EAA is interested in the CPM data quality control and documentation criteria.
Commissioner	- EAA (European Aluminium Association) 12 Av. de Broqueville B-1150 Brussels .
Practitioner	- EAA (European Aluminium Association) 12 Av. de Broqueville B-1150 Brussels .
Reviewer	Dr. Ian Boustead, - 2 Black Cottages West Grinstead, Horsham GB-West Sussex RH13 7BD
Applicability	--- SPECIFIC INFORMATION FOR THIS DATA SET --- ENERGY USE IN THE DIFFERENT INCLUDED PROCESS STEPS The energy directly consumed by the operations enclosed within the system bounderies, i.e. in the various production steps, are presented below. See the headline ''DATA SOURCES FOR FUELS/ENERGY PRODUCTION AND COMBUSTION'' in About Data for further information. ---Production of semi-finished aluminium--- Fuel oil (kg) 0,34 Gas (kg) 46,5 Electricity UCTPE* (kWh) 547 ---Process scrap recycling--- Fuel oil (kg) 0,41 Gas (kg) 33 Electricity UCTPE* (kWh) 75 * UCTPE 94 is an electrical energy model for energy supporting all processes in this system (including transports), except electrolysis and cast house. It is described in BUWAL 250, see litterature references. ENERGY CONSUMPTION - INFLUENCE OF ALLOY GRADE AND INGOT HOMOGENEISATION TREATMENT This data set represents an average aluminium alloy. Different alloy types have different energy consumption data; some alloys undergo ingot homogeneisation thermal treatment; hard alloys need more energy for rolling than soft alloys or unalloyed aluminium. In the table below you can find some examples of the variation. The values are presented per 1000 kg rolled aluminium sheet. Alloy groups: I. includes unalloyed aluminium (all 1xxx designations) II. includes alloyed aluminium designated 3xxx, 5xxx (Mg<2,5%), 6xxx and 8xxx III. includes alloyed aluminium designated 2xxx, 5xxx (Mg>2,5%) and 7xxx Electricity consumption (kWh) I II III Overall weighted average non-homogenised 592 642 661 622 homogenised 637 687 706 667 Gas consumption (kg) non-homogenised 79,3 79,6 79,5 79,5 homogenised 94,3 94,6 94,5 94,5 --- GENERAL INFORMATION VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- RECOMMENDATIONS BY EAA WHEN USING THE DATA The data provided by the EAA members for their own process steps are the most up-to-date average data available for these processes, and it is recommended that they be used for LCA purposes. Older literature data should be disregarded, as it may no longer be representative due to technological improvements, progress in operating performance, changes with regard to raw materials or waste treatment, etc.

	To complete the product system inventory, data - on the production of consumer products, from semi-fabricated aluminium, - on the performance of consumer products in the use phase, and - on the recovery of scrap prior to remelting at the end of the product's useful life should be acquired. EAA recommend that these data be used in LCA studies in accordance with methodologies within the framework of the international standards in the ISO 14040-series. RELATED DATA SETS IN SPINE DATA FORMAT The data presented in the Environmental Profile Report is reformatted in to the SPINE format and structured according to the SPINE concept in as many separate activities (sub-systems) as possible. The system scope for the study as a whole is primary aluminium production, semi-finished aluminium production, and recycling. The SPINE formatting resulted in 7 activities. These activities are all published in the SPINE@CPM database. The production and recycling step are intended to be used together. For example, to obtain a cradle to gate-system for rolled aluminium sheet, the activity Primary aluminium production should be connected to the activity Production of rolled aluminium sheet. A recycling step (Aluminium recycling by refiners) could also be connected to such a system, depending on the scope. -- List of activities formatted in the SPINE-format, published in SPINE@CPM -- Primary aluminium production 1. Primary aluminium production Semi-finished aluminium product fabrication 2. Production of rolled aluminium sheet 3. Production of extruded aluminium profiles 4. Production of 0,02-0,2 mm single-rolled aluminium foil 5. Production of 0,005-0,02 mm double-rolled aluminium foil Recycling 6. Re-melting of aluminium scrap 7. Aluminium recycling by refiners Please note: The recycling process 6. Re-melting of aluminium scrap is included in the semi-finished aluminium product fabrication, i.e. activities 2-5. When designing a product system with the activities above where recycled aluminium is regarded, the activity Aluminium recycling by refiners should be used. The Re-melting of aluminium activity is only a specification if the user is specifically interested in this process step. RECYCLING RATES FOR ALUMINIUM PRODUCTS AFTER USE After use, aluminium products are a valuable re-usable resource. The European recycling rates for end products are currently around 95% for the automotive sector and 85% for the building sector. IMPROVEMENTS IN THE ENVIRONMENTAL PERFORMANCE OF ALUMINIUM PRODUCTS AND PROCESSES OVER THE PAST FEW YEARS Over the past few years EAA has achieved major improvements in the environmental performance of its production processes by means of the following: - improvement on existing technology - development and introduction of new technology and operations - increased recycling of all materials in the production process. Examples of major environmental improvements in aluminium products achieved over the past few years include: - weight reduction by downgauging in the packaging sector - energy savings through weight reduction and subsequent fuel reduction in the transport sector - reduction of maintenance in the building sector The previous Ecological Profile Report from EAA was published in 1996.
About Data	--- GENERAL INFORMATION VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- PRECISION According to EAA, the environmental data figures in the inventory table are usually accurate to a precision of 5%. DATA SOURCES FOR FUELS/ENERGY PRODUCTION AND COMBUSTION The electricity supply systems and fuel production and use (transport energy and emission data) have been taken from SAEFL Environmental Series 250 (1998) 'Buwal 250' and EMPA report for EAA dated 27 April 1998, derived from Buwal 250 for national grid systems. All emissions connected with total fuel consumption (i.e. production and combustion of oil, gas or coal) have been taken from SAEFL Environmental Series 250 (1998) 'Buwal 250', table 16.9. Emissions from combustion only, i.e. excluding the contribution of the production

	of the fuel, have been considered where appropriate in order to make a direct comparision with the corresponding process emissions. Emission data for combustion came from a report prepared by EMPA for EEA (13 December 1997), showing the respective contributions of production and combustion of fuels in 'BUWAL 250, table 16.9'. Although emissions from fuel combustion were often covered in the industry survey reporting, data calculated from BUWAL 250 were always used, in view of the fact that the survey results were not sufficiently reliable due to inconsistent use of conversion factors. REVIEW OUTSPOKE Ian Boustead has reviewed and commented on the Environmental Profile Report for the European Aluminium Industry, April 2000, which is a revision of the first Ecological Profile Report from EAA that were published in 1996. Ian Bousteds' review comments on the Environmental Profile Report for the European Aluminium Industry, April 2000: ''...I have received the detailed calculations on which this present environmental report is based. All of the queries that I raised after working through these reports were answered satisfactory.'' Ian Bousted, Environmental Profile Report for the European Aluminium Industry, April 2000 ''Good-quality data were supplied by the EAA member companies, and the number of companies participating provides good coverage of the various processes, meaning that the results can be regarded as representative of the industryas a whole for the production of primary aluminium and subsequent conversion processes.'' Ian Bousted, Environmental Profile Report for the European Aluminium Industry, April 2000 ''Because of the very fragmented nature of the recycling industry and wide variations in practices, it is recognised that the data presented for this sector of the industry can only be regarded as indicative. Nevertheless it is helpful to have such information from an authorative source.'' Ian Bousted, Environmental Profile Report for the European Aluminium Industry, April 2000
Notes	REVIEWER Ian Boustead has reviewed and commented on the Environmental Profile Report for the European Aluminium Industry, which is a revision of the first Ecological Profile Report from EAA that were published in 1996. See AboutData for review comments.

SPINE LCI dataset: Production of self-adhesive labels etc used in the manufacturing, food and pharmaceutical industry

Administrative	
Finished	Y
Date Completed	1997-03-01
Copyright	
Availability	Public

Technical System	
Name	Production of self-adhesive labels etc used in the manufacturing, food and pharmaceutical industry
Functional Unit	1996
Functional Unit Explanation	The amounts given in the table shovs the total material flows of one year (1996). The extent of the production is not stated in the amount of manufactured labels.
Process Type	Gate to gate
Site	Strålfors Svenska AB Division Etikett Box 126 421 22 Västra Frölunda Sweden
Sector	Materials and components
Owner	Strålfors Svenska AB Division Etikett Box 126 421 22 Västra Frölunda Sweden

Technical system description	Production of self-adhesive labels and other information carriers used in the manufacturing, food and pharmaceutical industry. The methods used for printing are screen printing and letterpress printing. Besides this the company also produces repro and printing blocks.

System Boundaries	
Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries	
Allocations	
Systems Expansions	

Flow Data	
General Activity QMetaData	
Date Conceived	1996
Data Type	Unspecified
Represents	Not relevant.
Method	Study the Environmental Report for 1996. The amounts in the table are taken directly from the environmental report, and shows the resourses, residues and emissions for the annual production of 1996.
Literature Reference	---Rolled sheet production and process scrap recycling Industry survey from 1998 ---Transport energy, electricity, and air emission - SAEFL Environmental Series 250 (1998) ''BUWAL 250'', table 16.9 - EMPA report for EAA dated 27 April 1998, derived from Buwal 250 for national grid systems.
Notes	In this inventory profile it is possible to identify which process step (Rolled sheet production, Process scrap recycling) the flow is connected to and if it derives from the energy use, see Note-field for each specific flow. However, in order to get the numerical data devided on these two process steps, see Environmental Profile Report (EAA, 2000).

About Inventory

Publication	The environmental report from Strålfors Svenska AB for 1996, The Environmental Administration in the municipality of Göteborg -- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg. .
Practitioner	Svensson Maria, Olsson Morgan - Strålfors Svenska AB Division Etikett Box 126 421 22 Västra Frölunda Sweden.
Reviewer	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg.
Applicability	The extent of the production is not mentioned in the Environmental report. Because of this we have no functional unit which makes it impossible to use the data direct for life cycle analysis on one product. Though, it is possible to get in touch with the company and try to get some more information. The function of the system is described poorly and it is probably nessasary to contact the company for more information, if one wants to use the data.

About Data

SPINE LCI dataset: Production of Semichemical Fluting

Administrative	
Finished	Y
Date Completed	2000-01-18
Copyright	FEFCO, Groupement Ondulé, KRAFT Institute
Availability	The database is public and can be ordered without charge fro

Technical System	
Name	Production of Semichemical Fluting
Functional Unit	One ton of net saleable produced semichemical fluting
Functional Unit Explanation	Saleable means ready for delivery to customer.
Process Type	Gate to gate
Site	European average
Sector	Materials and components
Owner	European average

Technical system description	Semichemical Fluting is a component, the corrugated part, used for manufacturing of corrugated board. The Semichemical Fluting is made in a paper mill. These data are taken from ''European Database for Corrugated Board - Life Cycle Studies'' published by FEFCO, Groupement Ondulé and KRAFT Institute. These are the most resent data and are based on the year 1996. There will be an update in the year 2000 in which the data will be based on 1999. Only the processes within the mill are included. That is no transports to or from the mill are included. The forestry processes are not included. The raw material for Semichemical Fluting is wood, that is virgin fibres. Most of the wood is delivered to the mill in the form of pulpwood logs but a substantial part is brought to the mill as wood chips from saw mills. The pulpwood logs have to be debarked and chipped before further processing. Therefore logs pass through a barking drum and a chipper. The chips are then checked for oversized chips and other unwanted things. The oversized chips go through the chipper ones more. The chips are then stored in a chip pile before processing. The wood chips are cooked to pulp by the semichemical cooking process. It is a slightly alkaline cooking process with sodiumsulfite and sodiumcarbonate as active cooking chemicals. The pulp yield is normally around 80 %. The spent cooking liquor is drained off and washed out of the pulp. It contains wood substances as well as cooking chemicals. The liqour is concentrated and burnt for steam production and recovery of the cooking chemicals. The pulp is defiberized in refiners, screened and washed before being sent to the paper mill. The pulp is mechanical treated in beaters to improve fibre-to-fibre bonding and the strenght of the paper. The pH-level of the pulp slurry is adjusted with acid and some additives are added to facilitate the paper production. Finally the pulp slurry is screened and diluted before being sent to the head box of the paper machine. The paper is formed from the head box onto the wire and dewatered through the wire primarily by the action of gravity and suction. Since semichemical fluting is a paper with only one ply the paper machine has only one head box and one wire. Further dewatering by mechanical means take place in the press section where water is taken out of the sheet by pressing between felts. The final drying takes place in the drying section of the machine where the sheets run against heated cylinders to get its final dryness of 92%. The collected water is reused. After the paper machine there is a slitter winder where the big jumbo reel from the paper machine is rewound and cut down to customer reel formats according to customer orders. Finally the reels are weighted, marked, labelled and prepared for shipment to the customer, the corrugated board industry.

System Boundaries

Nature Boundary	Emissions from fuel combustion outside the mill is not included in the data. Emissions to air from the sites have been reported. Emissions from incineration of rejects with energy recovery at the mill are included. Emissions in the steam of the paper mill are not included. Emissions to air originating from the use of biogas from the mills anaerobic wastewater treatment are included. Water that is taken in has to be treated before it is used in the process, and it is again treated after the process before it is released as effluent to a recipient. The substances in the effluent after wastewater treatment are reported.
Time Boundary	The data are from 1996 and are the most resent ones. In the year 2000 there will be an update of the database which will be based on the year 1999.
Geographical Boundary	The data are valid for production of semichemical fluting in Europe they do not represent a specific plant but are average data from many plants all over Europe. The mills produce 80% of the semichemical fluting produced in Europe.
Other Boundaries	The production of raw material and resources is not included. Transports of raw materials, products and residues are not included.
Allocations	The system is considered as a closed loop system. This is not really true but is seen as a fairly good aproximation and is made to avoid allaocations. Within processes allocations has been made according to weight or according to the recipies for making the paper.
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1996-01-01
Data Type	Derived, statistics
Represents	European average
Method	The data are all taken from the Eropean Database for Corrugated Board-Life Cycle Studies
Literature Reference	European database for Corrugated Board-Life Cycle Studies

Notes	In this inventory profile it is possible to identify which process step (Rolled sheet production, Process scrap recycling) the flow is connected to and if it derives from the energy use, see Note-field for each specific flow. However, in order to get the numerical data devided on these two process steps, see Environmental Profile Report (EAA, 2000).

About Inventory	
Publication	Published in the report ''European Database for Corrugated Board-Life Cycle Studies'' by FEFCO, Groupement Ondulé and KRAFT Institute in 1997. -- Data documented by: Åsa Ekdahl, M Sc. student at the dept. of Environmental Systems Analysis, Chalmers University of Technology and SKF Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology Published in SPINE@CPM: 5 September 2001 --
Intended User	The intended users are practit
General Purpose	The purpose is to provide the industry and its customers the up-to-date knowledge, based on facts concerning the impact of the industry on the environment. Through this database the industry aims to make a contribution to the increasing need for basic environmental data for LCA studies, available in a transparent way.
Detailed Purpose	This data set has been documented for use in the study: ''LCA on SKF's Spherical Roller Bearing 24024''. The aim of the study is to descibe the environmental properties of the bearing as well as identify the processes contributing most to the environmental impact.
Commissioner	KRAFT Institute - Norrtullsgatan 43 S-113 45 Stockholm .
Practitioner	Manufacurers of Corrugated Board in Europe - .
Reviewer	
Applicability	The data can be used for the production of semichemical fluting in Europe that follow the process steps presented under ''Function''. The data are average for plants in Europe and do not represent a specific plant. Data for the production of Kraftliner and a Corrugated board box from the ''European Database for Corrugated Board-Life Cycle Studies'' is also available in SPINE@CPM. These activites are named: - Production of Kraftliner - Production of a Corrugated Board Box (182*62*182)
About Data	
Notes	The database will be updated in the year 2000 with data from the year 1999.

SPINE LCI dataset: Production of SKF Spherical Roller Bearing 232/530

Administrative	
Finished	Y
Date Completed	02-12-31
Copyright	
Availability	Public

Technical System	
Name	Production of SKF Spherical Roller Bearing 232/530
Functional Unit	One Spherical Roller Bearing (1204 kg Packed bearing)
Functional Unit Explanation	One Spherical Roller Bearing 232/530 (packed in a plywood box) manufactured at SKF in Göteborg, Sweden. The packed bearing weighs 1204 kg and the ingoing components are: 1. one inner ring 2. one outer ring 3. one guide ring 4. one brass cage 5. 36 rollers (coated or non-coated) 6. One plywood box. Dimensions of the bearing 232/530: di= 530 mm dy= 980 mm breadth= 355 mm The functional unit for this process is ONE SKF SRB 232/530. The activities for the production of the separate ingoing components are also available at SPINE@CPM: * Production of bearing rings * Production of brass cages used for spherical roller bearings * Production of guide rings used for spherical roller bearings * Production of bearing rollers (á 9.2 kg) * Production of plywood boxes
Process Type	Cradle to gate
Site	SKF Large Bearings
Sector	Materials and components
Owner	SKF Large Bearings
Technical system description	This life cycle assessment of spherical roller bearings is made at the request of SKF Industrial Division. This study is a case specific investigation of the production of spherical roller bearings produced at the production site of SKF Sverige AB in Göteborg, Sweden during the years 2000 - 2002. The spherical roller bearing 232/530 that is investigated in this report has the following components: -Inner ring 232/530 IR, 356 kg -Outer ring 232/530 OR, 387 kg -36 bearing rollers RS-232/530 C, 9.2 kg -Brass cage CS 232/530 CAM, 55.6 kg -Guide ring RG-232/530 C/243475, 9.6 kg and is packed in a plywood box, 52,61 kg. This dataset includes the following activities: 1. Production of brass cages used for spherical roller bearings 2. Production of bearing rollers (á 9.2 kg) 3. Production of bearing rings 4. Production of guide rings used for spherical roller bearings

	5. Production of plywood boxes 6. Production of Kraftliner 7. Extraction of crude oil 8. Refining of crude oil 9. Polyethylene (describing the production of Polyethylene) Detailed information about these subactivities can be obtained from SPINE@CPM. The assembly of the final product, the roller bearing 232/530, takes place at the C-factory at SKF in Göteborg, Sweden. All mounting is done by hand. As a last step before packing the bearing is treated in a rust protective bath. Then the bearing is packed in a plywood box together with rust protection paper (VPI paper) and plastic foil. The rust protection paper is in this study approximated with normal kraftliner, since the product contains 84% kraftliner. The data set for the production of Kraftliner has been obtained from the SPINE@CPM database. The supplier of the rust protection paper is Bröderna Ljungkvist AB and their production plant is located in Lich in Germany. The transport from Germany to SKF in Göteborg IS included in this study. The anti corrosive agent in the rust protection bath has been approximated with crude oil, and thus the activities 7 and 8 are included in this study. The LDPE foil is manufactured by TrioPlast AB in Smålandsstenar. Their subsupplier is located in Germany. For the production of polyethylene, a dataset from the SPINE@CPM database has been used(see Polyethylene). For more detailed information see the Master thesis: LCA based solution selection; Helene Berg and Sandra Häggström; Chalmers University of Technology; December 2002.

System Boundaries

Nature Boundary	See each separate sub activity. The raw material for the bearing steel is scrap, which is regarded as a resource not traced back to the cradle. All resources except for the bearing steel and the casting iron, are assumed to be virgin ones, i e produced by non-recycled material. In many of the activities included in the life cycle steel scrap is produced. The steel scrap produced at SKF in Göteborg is transported to Ovako Steel in Hofors for recycling. For all activities at Ovako Steel in Hofors and at SKF Mekan in Katrineholm, steel scrap is described as co-product in the outflow, since the scrap is reused in their own processes. Also for the steel production in Sheffield (raw material for the rollers), steel scrap is considered as co-product in the outflow. The used bearings that are considered worn out are scrapped and the steel is recycled at Ovako Steel AB in Hofors. For further info see the Master thesis: LCA based solution selection; Helene Berg and Sandra Häggström; Chalmers University of Technology; December 2002.
Time Boundary	The data was collected during the autumn 2002, and no changes in the procedure are planned for the nearest future.
Geographical Boundary	The manufacturing of the bearing takes place at the SKF plant in Göteborg, Sweden.
Other Boundaries	All electricity production is included in the dataset. All production of other energy carriers like LPG, Fuel oil and Diesel is also included in the dataset. The transports from the suppliers to SKFs site in Göteborg and the diesel production for this are included. For detailed information about transports included see the Master thesis: LCA based solution selection; Helene Berg and Sandra Häggström; Chalmers University of Technology; December 2002.
Allocations	Allocations have been made mainly according to weight. See under each separate acitivity. For detailed information see the Master thesis: LCA based solution selection; Helene Berg and Sandra Häggström; Chalmers University of Technology; December 2002.
Systems Expansions	Not Applicable

Flow Data

General Activity QMetaData

Date Conceived	02-08-01 - 02-12-31
Data Type	Derived, mixed
Represents	European average

Method	Data has preferably been collected from Environmental Reports and Safety Data Sheets. In some cases production data is monitored continually at the sites. The data from interviews with employees at the respective companies can be considered as expert out spokes. When data have not been available, persons familiar with the processes studied have made qualified estimations. Most data in the product system has been collected from specific sites and is therefore only valid for these. They can be used as approximations for other systems with care. Some components are produced abroad and data has then been collected from these specific sites. If no data was available from the specific sites, average production data from different databases (mostly CIT Ekologik AB and SPINE at CPM) has been used for the activities. This is described in detail for each activity available in the SPINE@CPM database.
Literature Reference	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002.
Notes	In this inventory profile it is possible to identify which process step (Rolled sheet production, Process scrap recycling) the flow is connected to and if it derives from the energy use, see Note-field for each specific flow. However, in order to get the numerical data devided on these two process steps, see Environmental Profile Report (EAA, 2000).

About Inventory	
Publication	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ----------- Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Data reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.
Intended User	Product developers at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.
Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Helene Berg - .
Reviewer	Olle Ramnäs -
Applicability	The dataset is applicable to the manufacturing of SKF spherical roller bearing 232/530 at SKFs site in Göteborg, Sweden. This study is a case specific investigation of the production of spherical roller bearings produced at the production site of SKF Sverige AB in Göteborg, Sweden during the years 2000 - 2002
About Data	Most data in the product system has been collected from specific sites and is therefore only valid for these. They can be used as approximations for other systems with care. Some components are produced abroad and data has then been collected from these specific sites. If no data was available from the specific sites, average production data from different databases (mostly CIT Ekologik AB and Spine CPM) has been used for the activities. This is described in detail for each activity available in the SPINE@CPM database. Data has preferably been collected from Environmental Reports and Safety Data Sheets. In some cases production data is monitored continually at the sites. The data from interviews with employees at the respective companies can be considered as expert out spokes. When data have not been available, persons familiar with the processes studied have made qualified estimations. For detailed information see the Master thesis: LCA based solution selection; Helene Berg and Sandra Häggström; Chalmers University of Technology; December 2002.

SPINE LCI dataset: Production of Soap from palm oil/palm kernel oil

Administrative	
Finished	Y
Date Completed	92-04-01
Copyright	Carl Hanser Verlag
Availability	Public

Technical System	
Name	Production of Soap from palm oil/palm kernel oil
Functional Unit	1000 kg.
Functional Unit Explanation	All emissions, use of resources and energy consumption is based on 1000 kg of Soap made from palm/palm kernel oils.

Process Type	Cradle to gate
Site	Europe
Sector	
Owner	Europe
Technical system description	BRIEF DESCRIPTION: The following processes are involved in the production of soap from palm oil (PO) and palm kernel oil (PKO): Fresh fruit bunch harvesting: Operation include palm plantations in Malaysia, which is the major exportin country of palm oil/palm kernel oil. Crude palm oil production: The palm oil is produced from fresh fruit buches. The process includes palm extraction mills in Malaysia. Palm oil refining: Palm oil refining takes place in Malaysia. No further details were given on the refining process. Palm kernel production: Palm kernel is produced from fresh fruit bunches. The operation includes palm plantations in Malaysia. Crude palm kernel oil production: The crude palm kernel oil is produced from palm kernel. The process includes palm extraction mills and kernel crushing plants in Malaysia. Palm kernel oil refining: Palm kernel oil refining takes place in Malysia. No further details were given on the process. Fatty acid splitting: The PO and the PKO is split to varying chain length fatty acids. Salt production: The salt is used for caustic soda production. No details were given on the production. Caustic soda production: Caustic soda is used for the final saponification. No details were given on the production of caustic soda. Saponification The process is a continous one, where the fatty acids are neutralized with caustic soda to form soap. Information concerning all the subsystems described above: Transports are included in the system. The fuels for the transports and the fuels for the processes are traced back to the extraction of petrochemical raw materials and/or extraction of bio fuels. The electricity data are based on the electricity profile for each country and the petrochemical and biomass raw materials for electricity production are traced back to the extraction process (same process as for fuel raw materials).

System Boundaries	
Nature Boundary	All emissions are considered equivalent, independent of where they take place (locally, regionally, globally; in densely populated areas or rural areas).The detergent formulation, use and final disposal of the surfactants were not covered. All emissions are considered equivalent, independent of where they take place (locally, regionally, globally; in densely populated areas or rural areas).
Time Boundary	The process data used pertain mainly to 1992, being yearly averages where possible. It is recognised that operating processes and conditions are constantly evolving.
Geographical Boundary	This study examined the surfactant production in Europe, notably manufacturing processes conducted in Belgium, France, Germany, Italy, the Netherlands, Spain and the United Kingdom. Some raw materials are produced outside of Europe. Therefore relevant input data from Malaysia, the Philippines and the United States of America have also been incorporated.
Other Boundaries	The detergent formulation, use and final disposal of the surfactants were not covered. The environmental effects associated with the manufacture of capital equipment and with energy and fuel requirements for plant and building conditioning (heat, air etc.) were not included, neither were those associated with personnel requirements. For electricity based on nuclear power and wind power, no emissions and resource exploits have been accounted for.

Allocations	Raw materials, energy and environmental emissions are allocated among co-products on an output weight basis, i.e. on the basis of mass. Co-products in this LCI include those materials that are currently recycled, reused or marketed in some beneficial way.
Systems Expansions	N/A (unless aggregated system from special type of comparative LCI study)

Flow Data	
General Activity QMetaData	
Date Conceived	92-04-01
Data Type	
Represents	European average
Method	LCI data from tables 2, 10 and 14 on pages 160-167 in lit. ref.
Literature Reference	Tenside Surfactants Detergents; 32. Jahrgang 2/1995; Carl Hanser Verlag; Munchen
Notes	The raw material data are given in ''kg'' and the energy data are given in ''MJ''. However, it is important to remember that the raw materials themselves have an energy content.

About Inventory

Publication	Tenside Surfactants Detergents; 32. Jahrgang 2/1995; Carl Hanser Verlag; Munchen -- Data documented by: Malin Ericson, Akzo Nobel Surface Chemistry Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	Manufacturers and users of sur
General Purpose	-To produce an authoritative and comprehensive Life Cycle Inventory for major surfactant production in Europe through a common approach in order to facilitate objectivity in surfactant assessments on environmental grounds. -To secure the best possible validation of data and broad acceptance of the methodology and conclusions by industry, regulatory authorities, and academia, through assessment of the study by an appropriate expert review panel.
Detailed Purpose	-To establish an industry-wide inventory of the energy and emissions associated with the production of major surfactants in Western Europe under the conditions prevailing in 1992. -To bring together environmental data on the use of the main raw material sources - crude oil, natural gas, mineral, oleochemical, agricultural feedstock - for the processing pathways to the derived major surfactants. -To provide benchmarks for the processing steps of surfactant production against which individual producers can assess their own processes and identify opportunities for improvement. -To publish the results of the study and its conclusions in the open literature for access and reference by interested bodies.
Commissioner	- European LCI Surfactant Study Group (CEFIC/ECOSOL).
Practitioner	- Franklin Associates, Ltd. 4121 W. 83rd St., Suite 108 Prairie Village, KS 66208, USA.
Reviewer	Klöppfer, Prof. Dr. W. - C.A.U. Consultants Frankfurt, Germany
Applicability	It is generally not possible to replace one surfactant type by another without changing other components of a preparation, or altering performance characteristics. Therefore, it is not in general meaningful to compare surfactants on a weight basis. Soap is one of the oldest surfactants having been widely used since ancient times. In practice and certainly in its predominant forms, the fatty acid in soap is rarely unique but comprises a range of alcohol chain lengths stemming from oleochemical feestock (animal and vegetable). Soap continues to be the major surfactant in the world. However, soap use has declined in Western Europe due to the increasing use of petrochemical based surfactants.
About Data	13 industrial companies participated in the project, including major surfactant manufacturers, raw material and intermediate suppliers, as well as surfactant users in Europe, some of whom are both manufacturers and users. Participating companies are BASF, Colgate-Palmolive, Condea, Enichem Augusta, Henkel, Hoechst, Hüls, ICI, Petresa, Procter & Gamble, Shell, Unilever and Wibarco. Process data were obtained directly from each company performing the process. These data were often proprietary. Therefore, technical process data from private corporations were collected from a minimum of three producers for each intermediate and surfactant type. The information is presented in the form of industry averages in order to preserve confidentiality. Fuel-related data for European countries were based on various governmental statistics and industry contacts (aggregated and provided by Dr. I. Bousted, The Open University, UK).

Notes	Data for other surfactants such as Alcohol sulphates (AS), Alcohol ethoxy sulphates (AES), Linear alkylbenzene sulphonates (LAS), Secondary alkane sulphonates (SAS), Alcohol ethoxylates (AE) and Alkyl polyglucosides (APG) were given in the same study.

SPINE LCI dataset: Production of sodium sulphate

Administrative	
Finished	Y
Date Completed	1991-01-01

About Inventory

Publication	Baumann H, Eriksson E, Rydberg T, Tillman A-M ''Life cycle analysis of selected packaging materials. Quantification of environmental loadings.'' Offprint from SOU 1991:77, Chalmers Industriteknik, Göteborg, Sweden -- Data documented by: Maria Erixon and Sara Ågren, project employed at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Henrikke Baumann and Anne-Marie Tillman (responsible for the course material) and Ann-Christin Pålsson (responisble for classification of the dataset), Technical Environmental Planning, Chalmers University of Technology --

Intended User	A Life Cycle Assessment practi
General Purpose	To investigate what energy needs and emissions that is connected with the production and use of glass.
Detailed Purpose	To show the energy consumption for production of Solvey soda.
Commissioner	- Swedish commission of packaging.
Practitioner	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden .
Reviewer	
Applicability	The emission factors for stationary installations of oil combustion can be found under the activity ''Combustion of oil'' in this database.
About Data	The inputs, (raw-)material, for the production of Solvey soda is not known.
Notes	

SPINE LCI dataset: Production of styrene (APME)

Administrative	
Finished	Y
Date Completed	1999
Copyright	APME
Availability	Public

Technical System	
Name	Production of styrene (APME)
Functional Unit	1 kg of styrene
Functional Unit Explanation	Styrene is a precursor for production of polystyrene, SBR, SB dispersions, ABS resins and unasaturated resins.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	The information given below comprises all available information in the datasheet from APME, from which this data set is acquired. Production of styrene includes all major operations from extraction of crude oil and gas to catalytic reforming of naphtha, solvent extraction and fractional distillation. The production of styrene monomer can be thought of as replacing one of the hydrogen atoms in ethylene by a benzene ring (C6H6). In practice, the production route from crude oil and natural gas is different. Crude oil refining produces a fraction known as naphtha which contains a mixture if low molecular weight, saturated hydrocarbons of various composition. This is converted into a smaller group of unsaturated hydrocarbons by cracking - a process in which the naphtha is heated to a high temperature in the absence of air, maintained for a short time at this high temperature and then very rapidly cooled back to a low temperature when all of the reactions stop and the mix of products is essentially fixed. The resulting mixture is then separated into its constituent components by distillation producing principally ethylene (C2H4), propylene (C3H6), mixed butenes of general formula C4H8 and a number of other compounds which find uses elsewhere in the petrochemical plant either as feedstocks or fuels. The precise mix of products from cracking are determined by a number of factors such as cracker temperature, residence time and the nature of the feedstock and the operation of a cracker can often be adjusted to produce the required mix of products. Natural gas is also converted into ethylene, propylene, butenes and other products by cracking.

	Although benzene is usually present in small quantities in crude oil, its direct extraction is usually uneconomic. However, one by-product of naphtha cracking is a liquid usually referred to as pyrolysis gasoline which is high in unsaturated aliphatic and aromatic hydrocarbons. The benzene fraction in pyrolysis gasoline can be extracted by repeated distillation and it is thought that about half of all benzene used in Europe is produced in this way. Benzene is also produced directly from naphtha by a process known as catalytic reforming. The basic feedstock is converted into a mixture of products of which the principal components are benzene, toluene and xylene (the process is often referred to as th BTX process). Benzene and other aromatics are isolated in the pure state from the output of the reformer by solvent extraction and fractional distillation. The relative proportions of benzene derived from the two sources vary from one operator to another but, in the later calculations, when the precise mix is unknown - as for example, when benzene is purchased on the open market - it is assumed that 50% is derived from each source. Subsystems: 1. Natural gas production 1. Crude oil production 2. Natural gas processing 2. Oil refining, for naphtha 3. Cracking for ethylene 3. Reforming for benzene 4. Reforming for benzene System: 1. Ethylbenzene production 2. Styrene production Styrene polymerisation (with polybutadiene) - gives high impact polystyrene. Styrene polymerisaton - gives crystal or general purpose polystyrene Styrene polymerisation (with pentane) - gives expandable polystyrene In addition to the mentioned sub-processes, the following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and deliver; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been tracked back to the extraction of raw materials from the earth. Operating conditions: As the data are based on information from 10 plants in 4 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency. For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded.

System Boundaries

Nature Boundary	''The data presented in the result tables are simply a listing of the data for which information is available''. Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have been estimated it instead. The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under the specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values. Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.
Time Boundary	Data refer to the year 1990-1994. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
Geographical Boundary	European average data. Results are based on data supplied by 11 styrene production plants in 6 countries: Belgium, France, Germany, Italy, Netherlands and UK. Their total production was 3,9 tonnes. For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For some intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production.

	The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.
Other Boundaries	The following excluded subsystems are explicitly mentioned in the Methodology report: - External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included). - Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals. - Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0,01% to the totals. No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Metholodogy report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass. European average data. Results are based on data supplied by 11 production plants in 6 countries: Belgium, France, Germany, Italy, Netherlands and UK. Their total production was 3,9 million tonnes.
Allocations	In the Methodology report and the different ''Eco-profiles...'' reports, the following general co-product allocations are mentioned: - Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values. - Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis. - Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc. - Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g. sulphuric acid is used as a drying agent for chlorine, therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis. - Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process. - Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity. These allocations are general for data from APME, and only applicable for datasets where the above mentioned processes are included.ed to the electricity.
Systems Expansions	Not applied.

General Activity QMetaData

Date Conceived	1990-1994
Data Type	Derived, mixed
Represents	European average
Method	European average data. Results are based on data supplied by 11 production plants in 6 countries: Belgium, France, Germany, Italy, Netherlands and UK. Their total production was 3,9 million tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstram raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. Data from APMEs website www.lca.apme.org have been downloaded as exe-

	files. The files are opened and imported into Microsoft Excel. Further, the data from MS Excel is exported to a MS Access database.
Literature Reference	APME, Association of Plastics Manufacturers in Europe, website: http://lca.apme.org/reports/htm/alphabetical.htm
Notes	For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded. See Notes in Inventory for a list of how the nomenclature for substances used by APME have been translated into the nomenclature used by CPM (CPM 2000:2) The Nomenclature for FlowTypes has in some cases been changed: Old name: Resources New name: Natural resource Old name: Waste New names: Residue Old name: Co-product New name: By-product Although the dataset contains a large number of decimals, which usually implies that there is a great accuracy in the data, we are somewhat questioning about this accuracy.

About Inventory

Publication	''Eco-profiles of the European plastics industry'', report for styrene. ''Eco-profiles of plastics and related intermediates: Methodology'', I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME's web site http://lca.apme.org. -- Documented by Caroline Sjöberg and Sofia Haargaard, Volvo Technological Development Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology Published in SPINE@CPM: 5 September 2001 --
Intended User	1. APME member companies 2. L
General Purpose	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.

Detailed Purpose	Eco-profiles are intended primarily as buiding blocks for use in the construction of complete life cycle analyses. 1. Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2. Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products. Objectives and areas of application for the Eco-profiles: - Plastics waste management studies - Internal company benchmarking - Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems. - Ensuring that the data are neutral. The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occured since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.
Commissioner	APME - Avenue E. van Nieuwenhuyse 4 Box 3 B-1160 Brussels Belgium.
Practitioner	Boustead, Ian - .
Reviewer	-
Applicability	European average data. Results are based on data supplied by 11 styrene production plants in 6 countries: Belgium, France, Germany, Italy, Netherlands and UK. Their total production was 3,9 tonnes. The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows. Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful. It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.
About Data	European average data for styrene production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data are probably fairly representative for production of styrene in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages. Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Note that emissions <0,5 mg (0,25 mg in data table) may be far below 0,5 mg in some cases. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity.

	According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. CO2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).
Notes	The following substance names have been changed from the nomenclature used by APME to adapt to nomenclature according to CPM report 2000:2. RESOURCES Old name New name Barite (Ba(SO4) Barytes Bauxite (Al2O3*H2O) Bauxite Chromium (Cr3+, Cr6+) Chromium Coal, hard unspecified Hard coal Gravel (unspecified) Gravel Hydro (primary energy) Hydro energy Olivin (unspecified) Olivin Phosphate (as P2O5) Phosphate Potassium chloid Potassium chloride Sand (unspecified) Sand Sulphur (elemental) Sulphur Wood (unspecified) Wood EMISSIONS Old name New name Aluminium ion Al Ammonium ion NH4+ Carbon disulfide CS2 Carbonate CO32- Chlorine Cl2 Chromium oxide CrO3 Copper (Cu+) Cu Ethane, 1-,2-, chloro 1,2-Dichloroethane Fluorine (F2) F2 Hydrocyanic HCN Hydrogen H2 Iron, Fe2+, Fe3+ Fe Mercaptans Thiols Metals (unspecified) Metals Nickel ion (Ni++) Ni Nitrate (NO3) NO3- Oils (unspecified) Oil Organo-Cl Chloroorganics Other organics VOC Particulates (unspecified) Particles Sulfuric acid H2S4 Vinylchloride Vinyl chloride VOC (hydrocarbons) VOC VOC (hydrocarbons, oil) VOC VOC (unspecified origin) m.fl. Technical System	
Name	Production of sulphuric acid by roasting of pyrite
Functional Unit	1 kg of sulphuric acid (100 %)

Functional Unit Explanation	
Process Type	Gate to gate
Site	
Sector	Materials and components
Owner	
Technical system description	The dataset is intended to represent production of sulphuric acid by roasting of pyrite. Data are taken from reports on fertiliser production, i.e. no specific site has been studied. The text below gives generic information of production of sulphuric acid, the data do not necessarily represent these techniques. Further information about interpretations of what the data represent is given in the flow data window. Sulphuric acid results from the production of sulphur dioxide, its conversion into sulphur trioxide and finally, absorption of sulphur trioxide by water, giving sulphuric acid. These reactions are exothermic to various extent, except for the production of sulphur dioxide from metal sulphate roasting or regeneration of sulphuric acid, and, in the case of brimstone as raw material, 1.1 to 1.2 t steam is produced per tonne sulphuric acid. This steam can, for example, be used to produce electricity and to concentrate phosphoric acid in adjacent plants. Since there are many different sulphur raw materials, there are several ways of producing sulphur dioxide as well (UNEP, 1996). Thereafter, the production route is less dependent on the original sulphur source, even though there are several processes for the conversion and the absorption stage (BAT N° 3, 1995). Approximately 0.33 t brimstone, 0.76 t pyrite (48 % S) or 1.2t zinc ore is typical raw material input for the production of 1t sulphuric acid (100%) (UNEP, 1996). Roasting of Pyrite Pyrite, or iron sulphide, is roasted in various types of furnaces, e.g. multiple-hearth furnace, rotary kiln and fluid bed roaster, producing a gas with a somewhat lower sulphur dioxide content than the combustion gases from burning elemental sulphur. This gas is then diluted to 8-10 % sulphur dioxide and treated in a high efficiency dust collector, e.g. electro-static dust collector, before conversion (BAT N° 3, 1995). The sulphur oxides is the main product and the iron oxides is the by-product (Patyk, 1996). Production of Sulphur Trioxide A catalyst, often containing alkali and vanadium oxides, is involved in the conversion of sulphur dioxide into sulphur trioxide (BAT N° 3, 1995). In case of roasting of metallic sulphides the sulphur dioxide containing combustion gases are first cleaned and dried, but if the sulphur dioxide is produced via sulphur burning, the air is dried before combustion (UNEP, 1996). If the oxygen concentration in the process gas is low after the combustion or roasting step, additional air or oxygen must be added prior to or during catalytic oxidation to ensure that there is an excess over stoichiometric needs for conversion of sulphur dioxide to sulphur trioxide. This reaction is highly exothermic and equilibrium becomes increasingly unfavourable for sulphur trioxide formation as temperature increases above 410-430°C. Unfortunately, this is the minimum temperature level required for typical commercial catalysts to function. As a result, plant catalytic converters are typically designed as multistage adiabatic units with gas cooling between each stage (Kirk-Othmer, vol. A 23, 1997). Production of Sulphuric Acid Single Contact Process In single contact plants, sulphuric trioxide is absorbed at the end of the process. Nowadays, this process is only used in new plants when the sulphur dioxide content of the combustion gas is low and widely varying (UNEP, 1996). After the conversion step the sulphur trioxide is absorbed in sulphuric acid in absorbers where it is converted to sulphuric acid by the water in the sulphuric acid. The absorbing acid is kept at the constant desired concentration of approximately 99 % by the addition of water or dilute sulphuric acid. If the concentration of sulphur dioxide in the combustion gas is between 6 and 10 %, the conversion efficiency is about 98 %. It is difficult to obtain more than 98.0 % in existing plants. The conversion ratio is somewhat lower if the concentration of sulphur dioxide in the combustion gas is less then 6 % (BAT N° 3, 1995). Double Contact Process In the early 1970s, air pollution problems led to the adoption of the double contact process or double absorption process (Kirk-Othmer, vol. 23). In this process there is a primary converter followed by an intermediate absorber, a secondary converter and a final absorber. The absorption of sulphur trioxide in the intermediate absorber shifts the equilibrium towards the formation of sulphur trioxide in the residual gas, resulting in an overall conversion efficiency of at least 99.6 % in case of sulphur burning. Feed gases containing 9-12 % sulphur dioxide is generally used for this process (BAT N° 3, 1995). Pressure Contact Process The oxidation of sulphur dioxide is favoured by high pressure and therefore, pressure contact processes has been developed. In these processes the sulphur dioxide conversion and the sulphur trioxide absorption are both carried out at high pressure. Even higher conversion ratio, 99.80-99.85 % is reported for this type of process. On the other hand, the temperature in the sulphur furnace is higher than the double contact process, which

increases the nitrogen oxide formation. The process also consumes more power and produces less steam than the conventional double-contact process. The process is not new but so far, it has only been employed in one industrial double-absorption plant in France (BAT N° 3, 1995).

Wet Contact Process
Contrarily to the conventional contact processes in which dry mixtures of sulphur dioxide and air are treated, wet gas is used in the wet gas process. This process has been employed to treat off-gases containing at least 10% hydrogen sulphide from cookeries, mineral oil refineries, fuel gasification or low-temperature carbonisation plants, natural gas cleaning installations, carbon bisulphide production plants and synthetic fibre plants. The hydrogen sulphide in the treated off-gas is first burnt to sulphur dioxide and water (steam) and the sulphur dioxide is then converted to sulphur trioxide which together with the formed steam yields sulphuric acid. The concentration of the produced acid is between 78 and 93 %. Gases with a lower hydrogen sulphide content than 10% have to be burnt by additional heating, e.g. fuel gas, oil or sulphur (UNEP, 1996). The conversion efficiency, regarding sulphur dioxide, of the Wet Contact Process is normally about 95-98 % (BAT N° 3, 1995).

Other Processes
The Modified Lead Chamber process is able to treat gases with a low content of sulphur dioxide, 0.5-8 %, but also gases containing a mixture of sulphur dioxide and nitrogen oxides. The nitrogen oxides are used to promote acid production directly from sulphur dioxide. The process is potentially useful for cleaning the off-gases from power plants and ore roasting plants. The conversion efficiency is almost 100% for sulphur dioxide contents between 0.5 and 8 % but emissions of nitrogen oxides occur to relatively high extent (BAT N° 3, 1995).

There is also a process in which hydrogen peroxide is used to convert sulphur dioxide to sulphur trioxide. The efficiency is higher than 99 % and no waste is generated but the cost for hydrogen peroxide makes this process uneconomic for sulphuric acid production, unless emissions lower than those of the double contact process are required (BAT N° 3, 1995).

The most recent and rather radical development in sulphuric acid technology has taken place in Russia. A process in which the gas flow is periodically reversed over a single-bed converter has been reported. It is claimed that this process permits the treatment of gases of low and variable concentrations of sulphur dioxide, without the need for much of the expensive heat exchange equipment associated with other processes (BAT N° 3, 1995).

About Inventory

Publication	Davis J, Haglund C (1999). ''Life Cycle Inventory (LCI) of Fertiliser Production - Fertiliser Products Used in Sweden and Western Europe''. SIK report no. 654. The Swedish Institute for Food and Biotechnology (SIK). Gothenburg, Sweden. -- Data documented by: Jennifer Davis, SIK (The Swedish Institute for Food and Biotechnology). Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The data are intended to be us
General Purpose	To generate an inventory of emissions and use of resources for the production of fertilisers used in Sweden.
Detailed Purpose	The purpose was not to compare production of different fertilisers to each other but to generate a thorough inventory of emissions and use of resources due to the production of fertilisers used in Sweden. The data are intended to constitute a useful basis of input information in life cycle assessments of food production systems. Production of sulphuric acid is one step in the line of production of fertilisers containing phosphorus produced in Sweden.
Commissioner	- SIK AB, The Swedish Institute for Food and Biotechnology Box 5401 SE-402 29 Gothenburg Sweden .
Practitioner	Davis, Jennifer and Caroline Haglund - SIK AB Box 5401 402 29 Gothenburg Sweden.
Reviewer	-
Applicability	Applicable for roasting of sulphide in Europe. The data are intended to be used as input information for the production of phosphoric acic that is used in fertiliser production at Hydro Agri AB in Köping, Sweden. The phosphoric acid is imported from Kemira Chemicals in Finland who produces their sulphuric acid by roasting of pyrite. The sulphuric acid is then used to produce phosphoric acid. As no information of production of this sulphuric acid by roasting of pyrite was found, it was

	assumed that roasting of sulphide is equivalent concerning generation of steam. The dataset is included in aggregated datasets for production of fertilisers at Hydro Agri AB in Köping.
About Data	The only emissions taken into account are emissions of SO2 and SO3 due to lack of information. All data are taken from literature, no specific site has been studied.
Notes	Internal review of the report was performed by: Olle Ramnäs, CTH (Chalmers University of technology), Berit Mattsson and Magnus Stadig, SIK (The Swedish Institute for Food and Biotechnology).

SPINE LCI dataset: Production of titanium dioxid

SPINE LCI dataset: Production of toluene diisocyanate (APME)

Administrative

Finished	Y
Date Completed	1999
Copyright	APME

Availability	Public

Technical System	
Name	Production of toluene diisocyanate (APME)
Functional Unit	1 kg of TDI
Functional Unit Explanation	TDI- toluene diisocyanate- is used as a precursor in the production of polyurethane.
Process Type	Cradle to gate
Site	Europe
Sector	Materials and components
Owner	Europe
Technical system description	The information given below comprises all available information in the datasheet from APME, from which this data set is acquired. Production of toluene diisocyanate include all major operations from extraction of crude oil and gas to catalytic reforming of naphtha, solvent extraction and fractional distillation. TDI, toluene diisocyanate, is one of the precursors used in the production of polyurethane. The input to the process is crude oil, natural gas, sulphur, coke/natural gas and sodium chloride. There are several intermediates. Ammonia is used for nitric acid production. For further information see literature ref. The following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and deliver; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been tracked back to the extraction of raw materials from the earth. Operating conditions: As the data are based on information from 10 plants in 4 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency. For raw materials, inputs as listed from APME, have been recorded in this data set. For ''Fuels & Feedstocks'', all fueltypes have been included. In addition, ''Total Energy'' for ''Hydro'', ''Nuclear'' and ''Recovered Energy'' fueltypes from ''Primary Fuels & Feedstocks'' have been included. ''Recovered Energy'' has been recorded in this data set as an outflow with positiv sign. For ''Water Use'' the total amount has been recorded.

System Boundaries	
Nature Boundary	''The data presented in the result tables are simply a listing of the data for which information is available''. Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have been estimated it instead. The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under the specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values. Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.
Time Boundary	Data refer to the year 1995-1996. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
Geographical Boundary	European average data. Data were supplied from 3 toluene diicocyanate producers in France, Germany, Italy. For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For some intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production. The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.

Other Boundaries	The following excluded subsystems are explicitly mentioned in the Methodology report: - External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included). - Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals. - Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0,01% to the totals. No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Metholodogy report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass. European average data. Results are based on data supplied by 3 production plants in 6 countries: France, Germany and Italy. Their total production was 372,000 tonnes.
Allocations	In the Methodology report and the different ''Eco-profiles...'' reports, the following general co-product allocations are mentioned: - Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values. - Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis. - Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc. - Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g. sulphuric acid is used as a drying agent for chlorine, therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis. - Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process. - Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity. These allocations are general for data from APME, and only applicable for datasets where the above mentioned processes are included.
Systems Expansions	Not applied.

Flow Data

General Activity QMetaData

Date Conceived	1995-1996
Data Type	Derived, mixed
Represents	As no data for production of sulphuric acid by roasting of pyrite was found, energy production was equalled to the steam generated for roasting of pyrite and the emissions were equalled to average values given by UNEP. The dataset is therefore not entirely representative for production of sulphuric acid.
Method	European average data. Results are based on data supplied by 3 production plants in 6 countries: France, Germany and Italy. Their total production was 372,000 tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstram raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. Data from APMEs website www.lca.apme.org have been downloaded as exe-files. The files are opened and imported into Microsoft Excel. Further, the data from MS Excel is exported to a MS Access database. Data were supplied by the three major producers in Europe, producing

	annually, and are thought to be representative of the current total production volume in Europe.

About Inventory

Publication	''Eco-profiles of the European plastics industry'', report for TDI. ''Eco-profiles of plastics and related intermediates: Methodology'', I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME's web site http://lca.apme.org. --- Documented by Caroline Sjöberg and Sofia Haargaard, Volvo Technological Development Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology Published in SPINE@CPM: 5 September 2001 ---
Intended User	1. APME member companies 2. L
General Purpose	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.

Detailed Purpose	Eco-profiles are intended primarily as buiding blocks for use in the construction of complete life cycle analyses. 1. Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2. Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products. Objectives and areas of application for the Eco-profiles: - Plastics waste management studies - Internal company benchmarking - Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems. - Ensuring that the data are neutral. The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occured since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.
Commissioner	APME - Avenue E. van Nieuwenhuyse 4 Box 3 B-1160 Brussels Belgium.
Practitioner	Boustead, Ian - .
Reviewer	-
Applicability	European average data. Results are based on data supplied by 3 production plants in 6 countries: France, Germany and Italy. Their total production was 372,000 tonnes. The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows. Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful. It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.
About Data	European average data for TDI production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data are probably fairly representative for production of TDI in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages. Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature. The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monotoring. The accuracy is often unknown. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45,0 MJ/kg for crude oil, 38,8 MJ/m3 (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes,

	before calculating the CO_2 emission. CO_2 emission values have been calculated from the composition of the fuel, assuming complete combustion: CO_2 emission = 3,67 x {mass fraction of carbon in fuel}/{calorific value in MJ/kg} (kg/MJ fuel).

Technical System	
Name	Production of TSP fertiliser
Functional Unit	1 kg of TSP fertiliser (48 % P2O5)
Functional Unit Explanation	TSP fertiliser (triple superphosphate), 48 % P2O5. 1 kg P2O5 = 0,4364 kg P.
Process Type	Gate to gate
Site	
Sector	Materials and components
Owner	
Technical system description	Data are taken from literature and reports on fertiliser production. The text below gives generic information about production of TSP (triple superphosphate) as no specific site has been studied. For further information on what the data represent in this dataset, please see the flow data window. Production of triple superphosphate (TSP) Triple superphosphate is produced by acidulating rock phosphate with phosphoric acid, instead of sulphuric acid as in the phosphoric acid process, and 70 % of the phosphorus in the product is supplied as acid and 30 % as rock (Kongshaug,1998). No gypsum is formed in this production step. There are two different triple superphosphate processes: the two step process and the slurry process. In the two step process a powder is produced in the first step, where the main energy consumption is for rock grinding. The powder is then granulated with steam in the second step. This process is based on phosphoric acid with a concentration of 48 % P2O5. The slurry process is based on phosphoric acid with a concentration of 42 % P2O5 and generally, this process consumes 20 % less energy than the two-step process. However, due to need of very soft rock and problems with unreacted rock in the product, this process is not always preferable. References: Kongshaug G (1998). Energy Consumption and Greenhouse Gas Emissions in Fertilizer Production. Hydro Agri Europe, Norway. EFMA (European Fertilizer Manufacturers' Association) Seminar on EU Legislation and the Legislation Process in the EU relative to Fertilizer, Prague, October 19-21 1998.

System Boundaries	
Nature Boundary	Emissions and use of resources due to the production of steam and electricity are not included.

Flow Data

General Activity QMetaData

Date Conceived	
Data Type	Derived, unspecified
Represents	
Method	More than 75 % of the triple superphosphate produced in Europe uses the two step process. According to Kongshaug (1998), energy consumption for this process, 2.0 GJ/t TSP (48% P2O5), has therefore been used as average value for production of triple superphosphate in Western Europe. This value has also been assesses to be representative for many plants outside Western Europe and consequently, also for production of triple superphosphate used in Western Europe. Of the total energy consumption 0.7 GJ/t TSP has been used for evaporation, 0.3 GJ/t TSP for powder production and 1.0 GJ/t TSP for granulation (Kongshaug 1998). The energy consumed due to evaporation has been assumed to be steam and the rest has been assumed to be electricity. See also ''Specif QMetaData''.

About Inventory	
Publication	Davis J, Haglund C (1999). ''Life Cycle Inventory (LCI) of Fertiliser Production - Fertiliser Products Used in Sweden and Western Europe''. SIK report no. 654. The Swedish Institute for Food and Biotechnology (SIK). Gothenburg, Sweden. -- Data documented by: Jennifer Davis, SIK (The Swedish Institute for Food and Biotechnology). Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The data are intended to be us
General Purpose	To generate an inventory of emissions and use of resources due to the production of fertilisers used in Sweden and Western Europe.
Detailed Purpose	The purpose was not to compare the production of different fertilisers with each other, but to generate a thorough inventory of emissions and use of resources due to this production. The data are intended to constitute a useful basis of input information in life cycle assessments of food production systems.
Commissioner	- SIK AB, The Swedish Institute for Food and Biotechnology Box 5401 SE-402 29 Gothenburg Sweden .
Practitioner	Davis, Jennifer and Caroline Haglund - SIK AB Box 5401 402 29 Gothenburg Sweden.
Reviewer	-
Applicability	The data are applicable for production of TSP fertiliser that is used in Western Europe. The dataset is included in the aggregated dataset for production of TSP fertiliser (cradle to gate).
About Data	The data are gathered from literature and reports on fertiliser production, i.e no specific site has been studied.
Notes	Internal review of the report was performed by: Olle Ramnäs, CTH (Chalmers University of Technology), Berit Mattsson and Magnus Stadig, SIK (The Swedish Institute for Food and Biotechnology).

Owner	Western Europe

Technical system description	The route of production for TSP (triple superphosphate) fertiliser can be seen in the aggregated activity window. For further information on the production processes, please see each included dataset. Emissions from transports, energy consumption and production of steam and electricity have been included in the system by using information and emission factors from the database in LCAiT 3.0. LCAiT 3.0 is a computer programme created by CIT Ekologik in Gothenburg for practitioners of life cycle assessments. Production/consumption of steam is assumed to replace/be produced by combustion of oil (efficiency of 0.90). Oil has been chosen as fuel source, as it in terms of emissions lies between coal and natural gas. Included transports and assumptions made regarding transports are described below (transports cannot be seen in the aggregated activity window). Concerning production of fertilisers used in Western Europe no specific sites have been studied and average distances have therefore been assumed. Since the contributions of transports to total amounts of emissions and use of resources were found to be small in the Swedish case (ref. to published report) where specific transports were included, the West European transports have not been studied in detail. The means of transports have been assumed to consist of boats (ship, bulk carrier) and trains (train, diesel). Due to lack of data, trains driven by diesel has been chosen to represent the transports by train, even though this might not be true in all cases. The distance for transportation of rock phosphate has been assumed to be 2000 km by boat and 500 km by train, as most of the rock phosphate is imported from North Africa and the Kola Peninsula in Russia. It has been assumed that the intermediate product phosphoric acid is produced at a site where it can be used directly in production of fertilisers. Phosphoric acid has therefore not been charged with any transports.

SPINE LCI dataset: Production of turned brass cylinders, 205 kg

Administrative	
Finished	Y
Date Completed	2002
Copyright	
Availability	Public

Technical System	
Name	Production of turned brass cylinders, 205 kg
Functional Unit	One turned brass cylinder, 205 kg
Functional Unit Explanation	One turned brass cylinder, 205 kg, will later be further processed into one brass cage (55,6 kg) used in the SKF spherical roller bearing 232/530.
Process Type	Gate to gate
Site	BecoTek ASIndustriveien 3, NO-3340 ÅMOT NORWAY
Sector	Materials and components
Owner	BecoTek ASIndustriveien 3, NO-3340 ÅMOT NORWAY
Technical system description	This activity describes a process step included in the system ''Production of brass cages used for spherical roller bearings'', also available in the SPINE@CPM database. The turned brass cylinders will serve as raw material for the activity ''Manufacturing of brass cages at SKFs site in Göteborg''. The brass cylinders are supplied by BecoTek AS in Norway. The brass is bought by BecoTek from Olof Manners AB in Mölndal, Sweden. The production of brass is NOT included in this dataset, but must be followed from the cradle for a total environmental impact. The production of turned brass cylinders takes place at BecoTek AS production plant in Åmot, Norway. First the brass is smelted in electric furnaces at the plant in Åmot, Norway. The smelt is then poured into a form and casted into desired shape. The cylinders formed are then turned in a turning machine and finally inspected and packed. All scrap produced in the process is recycled and used in the smelting process as raw material. The energy consumption was reported from BecoTek (= 1.19kWh/kg). Also internal transport by electric truck (40 m for each cylinder) and diesel truck (40 m for each cylinder) were reported. The environmental impact is probably significantly higher since no other inflows or outflows from the process are measured.

System Boundaries	
Nature Boundary	The production of brass is not included in this study, so the inflow of brass is coming from the technosphere. This MUST be accounted for when using the dataset to obtain the total environmental impact. (Data from brassproduction is available e.g. from CIT Ekologik AB, Chalmers) Emissions to water and air are not known for the production of turned brass cylinders in Norway. Only energy consumption (1,19 kWh/kg brass) and internal transport (40 m electric truck and 40 m diesel truck) are included from that process .
Time Boundary	The data is collected during autumn 2002. No changes in the procedure are planned for the nearest future.
Geographical Boundary	The brass cylinders are produced in Åmot, Norway.

Other Boundaries	The electricity production is NOT included. Average European electricity production should be used. Assumptions were made at BeTe Trucks AB in Sweden how much energy a dieseltruck and an electric truck consume per km (=0,75 KWh/km (el) and 0,3 litre/km (diesel)). The heating value for diesel (=35, 31 MJ/litre) was found at Internet: www.fast-tech.com and the diesel consumption could be calculated to 0,42372 MJ/40m. For the internal production with diesel truck and electric truck, the production of diesel and electricity are NOT included. Datasets for production of electricity and diesel can be bought at CIT Ekologik AB, Göteborg.
Allocations	Allocations have been made according to weight for the brass cylinder production. The internal transport is calculated specific for one turned brass cylinder, 205 kg.
Systems Expansions	Not applicable

About Inventory

Publication	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ----------- Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.
Intended User	Product developers at SKF.

General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.
Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Helene Berg - .
Reviewer	Olle Ramnäs -
Applicability	The data is valid for production of turned brass cylinders of this weight at the specific site at BecoTek AS in Åmot, Norway.
About Data	Data has been gathered from interviews with Eirik Hjerpaasen, BecoTek AS in Åmot, Norway.

SPINE LCI dataset: Production of Urea-formaldehyde resin 1202 (UF 1202), Wood Adhesive

Administrative	
Finished	Y
Date Completed	2000-03-07
Copyright	Casco Products
Availability	Public

Technical System	
Name	Production of Urea-formaldehyde resin 1202 (UF 1202), Wood Adhesive
Functional Unit	1 kg dry urea-formaldehyde resin 1202 (UF 1202)
Functional Unit Explanation	All emissions, use of resourses and energy consumption is based on 1 kg dry urea-formaldehyde resin 1202 (UF 1202). UF 1202 is a wood adhesive and is also namned Cascorit 1202. The wood adhesive is delivered with 70% dry content, of which is 70 % UF, 29,8 % water and < 0,2% free formaldehyde.
Process Type	Cradle to gate
Site	Europe
Sector	
Owner	Europe
Technical system description	Urea-formaldehyde resin 1202 (UF 1202) is a wood adhesive produced by Casco Products, Sweden. The main steps of UF 1202 production are: 1. Natural gas production: The study includes winning, delivery to shore and storage. Natural gas is used in the production of methanol and ammonia. 2. Methanol production: Natural gas is produced into synthesis gas in reformers. Synthesis gas is converted to raw methanol in a catalytic process and distilled into finished methanol. Storage is included. 3. Formalin production: Formalin is produced from methanol by oxidation in the Formox process. 4. Ammonia and urea production: Ammonia is produced from natural gas, air and water in a steam reforming process. In the process carbon dioxide is produced. The urea plant is situated on the same site as the ammonia plant. Urea is produced by reacting ammonia and carbon dioxide at 150 bar at an operation temparature of 185-190°C. The carbon dioxide used in the urea process comes from the

	ammonia process. Excess carbon dioxide is accounted for as emission to air. 4. Formic acid is produced from sodium formate and sulphuric acid with sodium sulphate as a by -product. This flow was not followed to the cradle. 5.Sodium hydroxide is produced from soduim chloride in an electrolythic reaction. 6. UF resin production: In a condensation reaction UF resin is produced from urea and formalin with very small amounts of formic acid and sodium hydroxide to control pH during reaction. A small amount of ammonia is added during the reaction to form triazinones. Vacuum distillation to 70% dry content for 1202 is included. Overall information: Transports are included in the system.

System Boundaries

Nature Boundary	All emissions are considered equivalent, independently of where they take place (locally, regionally, globally , in densly populated areas or rural areas) The emissions presented were chosen as relevant for the product type. Most of the used data are measured, some estimated.
Time Boundary	Most of the process data for the raw materials are valid for 1997, beeing yearly averages where possible. No great changes after that are estimated. The data from Casco Products factory in Kristinehamn are from 1998.
Geographical Boundary	The production of the raw materials natural gas, ammonia, methanol and urea is made on different sites in Europe. The production of formalin and urea-formaldehyde resin 1202 is made at Casco Products' factory, Kristinehamn, Sweden.
Other Boundaries	The packages for the product are not included in this study. (The main part is delivered in tank trucks) The transportation to the users, use and final desposal of the glue is not included. The environmental effects associated with the manufacture of capital equipement and with energy and fuel requirements for plant and buildings conditioning (heat, air, etc) were not included, neither were those associated with personnel requirements. Water consumption was not included.
Allocations	Emissions and waste at the Kristinehamn factory where the formalin and resin is produced are allocated on a mass basis among the products that may cause them. Energy required to heat storage buildings, etc is allocated on a mass basis among the products that are stored there. The steam generated in the formaldehyde process is used elsewhere in the factory. The energy produced is credited the formaldehyde.(See system expansion)
Systems Expansions	The production of formalin from methanol is an exothermic process.The heat produced is used for production of steam, which is utilised in other processes or for heating purposes. This steam replaces steam from oil that would otherwise have been needed. Therefor the steam produced in the process has been credited the formalin, i.e. oil consumption and emisssions were reduced. The amount of oil for production of steam on site and emissions from the boiler is known. (See Product Specific Requirements for Certified EPD for chemical products, www.environdec .com)

About Inventory

Publication	-- Data documented by: Birgit Nilsson, Casco Products, Sweden Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden Published in SPINE@CPM: 7 August 2001 --
Intended User	Users of Wood Adhesive Casco
General Purpose	
Detailed Purpose	To provide LCI data to producers of flooring, carpentry, furniture and other wood products where UF 1202 is used as an adhesive.
Commissioner	- Casco Products Box 11538, S-10061 Stockholm, Sweden .

Practitioner	Nilsson, Birgit - Casco Products Box 11538, S-10061 Stockholm, Sweden .
Reviewer	
Applicability	UF 1202 is a wood adhesive, which must be used with a hardener. There are hardeners for different purposes. It is widely used in the European wood working industry for example for flooring, block glueing, furniture, veneering and so on. It's content of free formaldehyde is <0.2 %. It must be used in hot- or high frequency presses. Data describing three other urea formaldehyde resins (wood adhesives) produced by Casco Products is available in the database; UF 1205, UF 1206 and UF 1274. Hardeners available in the database are Casco Products' Hardener 2545 and Hardener 2580. For more information about adhesives please contact Casco Products, 46 8 743 4000.
About Data	For the production of formaldehyde and UF 1202 all data originates from Casco Products' factory in Kristinehamn. For raw materials suppliers have participated. on terms thet their data will be treated confidentially. For urea and formic acid gate- to- gate data were provided, for methanol and sodium hydroxide gradle -to gateFor ammonia and fuel data from APME Ecoprofiles are used. Raw materials used are mentioned under ''Object of study/Functions) Overall information: Transports are included in the system. The fuels for the transports are traced back to the extraction of petrochemical raw materials and the extraction of bio fuels. The electricity data are based on the electricity profiles for each country . For coal, lignite and natural gas data from ETH,Switzerland have been used. For other kinds of energy data from Vattenfall, Sweden have been used. These are combined into energy mixes for different countries according to statistics of 1995 from ''Annual Energy Review 1997'' (European comission) Building of the power plant is not included.

Applicability	UF 1205 is a wood adhesive, which must be used with a hardener. There are hardeners for different purposes. It is widely used in the European wood working industry for example for flooring, block glueing, furniture, veneering and so on. It's content of free formaldehyde is 0,7 %. It is mostly cured in hot- or high frequency presses, but with suitable hardeners it can also be used at room temperature. There also exist UF glues with lower formaldehyde content that are more common than 1205. Other urea formaldehyde wood adhesives produced by Casco Products available in the database are UF 1206, 1202 and 1274. Hardeners available in the database are Casco Products' Hardener 2545 and Hardener 2580. For more information about adhesives please contact Casco Products, 46 8 743 4000
About Data	For the production of formaldehyde and UF 1205 all data originates from Casco Products' factory in Kristinehamn. For raw materials suppliers have participated on terms that their data will be treated confidentially. For urea and formic acid gate-to gate data were provided, for methanol and sodium hydroxide crdle-to gate. For ammonia and fuel data from APME Ecoprofiles are used. Raw materials used are mentioned under ''Object of study/Function. Overall information: Transports are included in the system. The fuels for the transports are traced back to the extraction of petrochemical raw materials and the extraction of bio fuels. The electricity data are based on the electricity profiles for each country . For coal, lignite and natural gas data from ETH,Switzerland have been used. For other kinds of energy data from Vattenfall, Sweden have been used. These are combined into energy mixes for different countries according to statistics of 1995 from ''Annual Energy Review 1997'' (European comission) Building of the power plant is not included.

Technical System	
Name	Production of Urea-formaldehyde resin 1206 (UF 1206), Wood Adhesive
Functional Unit	1 kg dry urea-formaldehyde resin 1206 (UF 1206)
Functional Unit Explanation	All emissions, use of resourses and energy consumption is based on 1 kg dry urea-formaldehyde resin 1206 (UF 1206). UF 1206 is a wood adhesive and is also namned Cascorit 1206. The wood adhesive is delivered with 65% dry content, of which is 65 % UF, 34.3 % water and 0,7% free formaldehyde.
Process Type	Cradle to gate
Site	Europe
Sector	
Owner	Europe
Technical system description	Urea-formaldehyde resin 1206 (UF 1206) is a wood adhesive produced by Casco Products, Sweden.The main steps of UF production are: 1. Natural gas production:

	The study includes winning, delivery to shore and storage. Natural gas is used in the production of methanol and ammonia. 2. Methanol production: Natural gas is produced into synthesis gas in reformers. Synthesis gas is converted to raw methanol in a catalytic process and distilled into finished methanol. Storage is included. 3. Formalin production: Formalin is produced from methanol by oxidation in the Formox process. 4. Ammonia and urea production: Ammonia is produced from natural gas, air and water in a steam reforming process. In the process carbon dioxide is produced. The urea plant is situated on the same site as the ammonia plant. Urea is produced by reacting ammonia and carbon dioxide at 150 bar at an operation temparature of 185-190°C. The carbon dioxide used in the urea process comes from the ammonia process. Excess carbon dioxide is accounted for as emission to air. 4. Formic acid is produced from sodium formate and sulphuric acid with sodium sulphate as a by -product. This flow was not followed to the cradle. 5.Sodium hydroxide is produced from soduim chloride in an electrolythic reaction. 6. UF resin production: In a condensation reaction UF resin is produced from urea and formalin with very small amounts of formic acid and sodium hydroxide to control pH during reaction. Distillation to 65% dry content for 1206 is included. Overall information: Transports are included in the system.

System Boundaries

Nature Boundary	All emissions are considered equivalent, independently of where they take place (locally, regionally, globally , in densly populated areas or rural areas) The emissions presented were chosen as relevant for the product type. Most of the used data are measured, some estimated.
Time Boundary	Most of the process data for the raw materials are valid for 1997, beeing yearly averages where possible. No great changes after that are estimated. The data from Casco Products factory in Kristinehamn are from 1998.
Geographical Boundary	The production of the raw materials natural gas, ammonia, methanol and urea is made on different sites in Europe. The production of formalin and urea-formaldehyde resin 1206 is made at Casco Products' factory, Kristinehamn, Sweden.
Other Boundaries	The packages for the product are not included in this study. (The main part is delivered in tank trucks) The transportation to the users, use and final desposal of the glue is not included. The environmental effects associated with the manufacture of capital equipement and with energy and fuel requirements for plant and buildings conditioning (heat, air, etc) were not included, neither were those associated with personnel requirements. Water consumption was not included.
Allocations	Emissions and waste at the Kristinehamn factory where the formalin and resin is produced are allocated on a mass basis among the products that may cause them. Energy required to heat storage buildings, etc is allocated on a mass basis among the products that are stored there. The steam generated in the formaldehyde process is used elsewhere in the factory. The energy produced is credited the formaldehyde.(See system expansion)
Systems Expansions	The production of formalin from methanol is an exothermic process.The heat produced is used for production of steam, which is utilised in other processes or for heating purposes. This steam replaces steam from oil that would otherwise have been needed. Therefor the steam produced in the process has been credited the formalin, i.e. oil consumption and emisssions were reduced. The amount of oil for production of steam on site and emissions from the boiler is known. (See Product Specific Requirements for Certified EPD for chemical products, www.environdec.com)

About Inventory

Publication	Baumann H, Eriksson E, Rydberg T, Tillman A-M ''Life cycle analysis of selected packaging materials. Quantification of environmental loadings.'' Offprint from SOU 1991:77, Chalmers Industriteknik, Göteborg, Sweden. -- Data documented by: Maria Erixon and Sara Ågren, project employed at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Henrikke Baumann and Anne-Marie Tillman (responsible for the course material) and Ann-Christin Pålsson (responisble for classification of the dataset), Technical Environmental Planning, Chalmers University of Technology --
Intended User	A Life Cycle Assessment practi
General Purpose	To investigate what energy needs and emissions that is connected with the production and use of glass.
Detailed Purpose	To show the energy consumption for production of washing soda.
Commissioner	- Swedish commission of packaging.
Practitioner	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden .
Reviewer	
Applicability	The emission factors for stationary installations of oil combustion can be found under the activity ''Combustion of oil'' in this database.
About Data	The inputs, (raw-)material, for the production of washing soda is not known.
Notes	

SPINE LCI dataset: Production of Wetfix I (adhesion promoter used in hot mix for asphalt pavement)

Availability	Public

Technical System	
Name	Production of Wetfix I (adhesion promoter used in hot mix for asphalt pavement)
Functional Unit	1 kg of Wetfix I
Functional Unit Explanation	To get an idea of the order of magnitude of the functional unit, an example is the model of the asphalt pavement studied in the report: 1235 ton of hot mix are used per layer of 1 km road. The road is 13 m wide. 2 layers are needed for the construction of the road. 3 layers will be added during the maintenance operations over 40 years. Over the life cycle of the asphalt pavement presented in the report, Wetfix I is assumed to be dosed up to 0,4% per weight of bitumen (Worst case scenario). The bitumen part of the hot mix asphalt pavement is 6%. Therefore 240g Wetfix I may be used for 1 ton of hot mix asphalt pavement.
Process Type	Cradle to gate
Site	Europe
Sector	
Owner	Europe
Technical system description	Production of Wetfix I. Wetfix I is an adhesion promoter used in hot mix asphalt pavements. It is a surface-active material that concentrates at the interface between the bitumen and the aggregate''s

surface.

The inventory includes the production of the raw materials as well as the production of the fuels needed. In general all flows are followed from the cradle (nature). The energy and material resources are traced back to the extraction of natural resources.
The production of electricity used in different parts of the system studied have been included. The production of electricity includes operation and maintenance of the power plants and the production of fuel used for the electricity production. National electricity grids has been applied when no spcecific electricity supplier is known.
All transports used inlude the environmental load from cradle to gate: all inputs are tracked to the cradle, being material or energy.. (for instance the fuel production, cradle to gate is included)

The following systems are the most importanat systems included:

1. Production in Stockvik
1.1 Wetfix I is manufactured in Stockvik (outside Sundsvall, Sweden).
¤ Step 1. Production of Wetfix IC
Mixing of the raw materials (TOFA and VEA) and heating.
¤ Step 2. Production of Wetfix I
Mixing of Wetfix IC with the Solvent.

1.2 Steam
The steam used at the Stockvik plant is produced by using a complex fuel mix. The emissions from the steam production are included. The production of the fuels are included in the system when they are not by-products (14%). The steam is supplied by a neighbouring plant.

2. Raw material productions etc.
2.1 VEA
VEA stands for Various Ethylene Polyamines. Ethyleneamines are manufactured in a continuous process by allowing an excess of ammonia to react under high pressure with ethylene dichloride (EDC). Sodium hydroxide and a very small amount of nitrogen are also involved in the process. The end-products are subsequently isolated from the reaction mixture by distillation. The production systems for the raw materials and utilities have been included.

2.2 TOFA
Tall Oil Fatty Acid
Crude tall oil is produced in a pulp mill (sulphate process). It is treated with sulphuric acid and distilled into Tall oil fatty acids, Distilled tall oil and Tall oil rosin. Light oils and pitch are by-products.

2.3 Solvent
The solvent is a by-product. It is not tracked from the cradle because it is considered as a waste stream. According to the supplier, the solvent has almost no commercial value and would be sent for destruction if it was not used as a raw material for Wetfix I.

2.4 IPA
Isopropyl alcohol is used together with water to wash the reactor at the Wetfix I production plant.
The raw material for the production of isopropyl alcohol is propylene. The utilities used at the plant are electricity and steam. The production systems for the raw materials and utilities have been included.

2.5 Nitrogen
To produce nitrogen, air is first cooled using compressors and then separated into oxygen, argon and nitrogen. It is often sent to the user by pipeline.

3. Transports (Some distances are not dipslayed below for reasons of confidentiality)
3.1 Transport of Solvent:
From Germany to Stockvik, Sweden:
Lorry, 40 ton, 50%, Europe XX km
Ferry, , 700-7000 ton, 60%, Sweden 150 km
Train, electric, 50%, Sweden 950 km

3.2 Transport of VEA:
From the Netherlands to Stockvik.
Train, electric, 46%, the Netherlands XX km
Train, diesel, 50%, Europe (DK) 217 km
Ferry, 700-7 000 ton, Sweden 25 km
Train, electric, 50%, Sweden 876 km

¤ The transports Netherlands-Stockvik are estimated with the Michelin website and therefore calculated on a road basis. In reality, the route is using the railway.
¤ The trains are estimated by the Dutch train before the Danish border and EU train before they reach the Swedish border beyond which Swedish train data are used.

3.3 Transport of TOFA:
From the production plant to Stockvik:
Lorry, 40ton, 50%, Sweden.

3.4 Transport of IPA:
From the Netherlands to Stockvik; SE.
Lorry, 40 ton, 70%, Europe XX km

	Ferry 700-7000 ton, 60%, Sweden 25 km Over the total cradle to gate inventory, electricity is required, although the electricity input is tracked to the cradle and its impact is included (emissions and natural resource use), it is of interest to inform about the internal flow of electricity. The total electricity requirements are as follows: Electricity - biomass 0,0619 kWh Electricity - coal 0,3012 kWh Electricity - hydro 0,0435 kWh Electricity - mix 1,0644 kWh Electricity - natural gas 0,6483 kWh Electricity - nuclear 0,0419 kWh Electricity - oil 0,0398 kWh Electricity - wind 5,98e-03 kWh Note that the production of electricity is tracked from the cradle and included in the inventory (as natural resource use, emissions etc.). For litterature references see: ''About data''

System Boundaries

Nature Boundary	In general all energy and raw material resources are tracked back to the extraction of the natural resource. No emissions from the Wetfix I production site are included because the quantity of process water sent to incineration is negligible compared to other feeds and because no emissions is measured at the reactor. The emissions derived from the heat and electricity use is however included. Crude tall oil is a waste stream from pulp mills and is used as a raw material for Tall oil Fatty Acid. It is not tracked from the cradle because natural resource use, emissions etc. are allocated to the production of pulp. The treatment of crude tall oil with sulphuric acid and the distillation of crude tall oil are however included. A solvent is one of the raw materials for Wetfix I. It is not tracked from the cradle because it is considered as a waste stream. According to the supplier, the solvent has almost no commercial value and would be sent for destruction if it was not used as a raw material for Wetfix I. Different environmental impact due to different emissions in different geographical locations have not been taken into accont. All environmental flows of one substance from different locations have been added to one figure.
Time Boundary	Data for the production of Wetfix I and its raw materials are applicable for 2000. Data on transport were published in 2000. Some average data used upstream in the life cycle inventory were published in 1999 and compiled from data over 1992-1997. Data for different electricity grids are from 1997 and data for the different electricity production systems were published in 1996.
Geographical Boundary	The production site for the final product, Wetfix I, takes place in Stockvik, Sweden. The production sites of the raw materials are in the Netherlands (VEA) and Sweden (TOFA). For the solvent, only the transport to the Wetfix I production site was taken into account (see the ''Nature boundary'' field). IPA is produced in Holland and nitrogen in Sweden.
Other Boundaries	The environmental influence caused by the production of machines, industrial plants and infrastructure is not included. The transport of the different fuels from refinerys to the vehicle or the plant where it is combusted are not included. VEA The transport of nitrogen is not included. It may be performed by pipeline. The transport of the other raw materials i.e. sodium hydroxide, dichloroethane and ammonia are included. IPA The transport of propylene is not included in the system.
Allocations	VEA: Mass allocation.on the products from the distillation. TOFA: Mass allocation on the products from the distillation. The by-products therefore recieve no environmental load.
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	2001-02-13

Data Type	Derived, unspecified
Represents	Flows to and from nature for a cradle to gate inventory of 1 kg of Wetfix I.
Method	Data are from the appendix no. 4 in the litterature reference.
Literature Reference	RIES Adeline - ''Life cycle assessment of an adhesion promoter used in hot mix for asphalt pavement'' - Akzo Nobel / Chalmers University of Technology - 2001.
Notes	For 1 kg of hot mix, 0,24 g of Wetfix I are required according to the maximum dosage. For the amount of hot mix required for 1km of road, refer to the ''Functional unit explenation'' in the technical system.

About Inventory	
Publication	RIES Adeline - ''Life cycle assessment of an adhesion promoter used in hot mix for asphalt pavement'' - Akzo Nobel / Chalmers University of Technology - 2001. --- Data documented by: Adeline Ries, Master of Science thesis worker at Akzo Nobel Surface Chemistry Internal review at Akzo by: Klas Hallberg, Akzo Nobel Surface Chemistry Documentation review at CPM by: Ann-Christin Pålsson, CPM, Chalmers University of Technology ---
Intended User	Akzo Nobel Surface Chemistry.
General Purpose	The purpose is to determine the environmental impact from the adhesion promoter Wetfix I so that it is possible to compare its impact with the impact from the life of a hot mix asphalt pavement, where Wetfix I may be uesd, on an average Swedish countryside road. Then calculations can show how much the asphalt additive needs to extend the life of the asphalt pavement for the whole system to have a lower environmental load. If the adhesion promoter does not extend the life of the road at all an addition of it will simply increase the environmental load.
Detailed Purpose	To assess the environmental impact of a mass unit of adhesion promoter. To calculate the contribution of the adhesion promoter to the total impact from the asphalt pavement. To identify the segments of the life cycle that contribute most to the impact. To use the results of the study and seek improvement possibilities.
Commissioner	- Akzo Nobel Surface Chemistry AB 444 85 Stenungsund Sweden.
Practitioner	Ries, Adeline - 47bis rue Saint Georges F-37210 Rochecorbon France.
Reviewer	Ramnäs, Olle - Chemical Environmental Science Chalmers University of Technology 412 96 Göteborg Sweden
Applicability	Production of Wetfix I at the Akzo Nobel Stockvik plant, Sweden. Other adhesion promoters may have a completely different eco-profile.
About Data	Most electricity used correspond with the Swedish average (electricity grid from 1999 and inventory for each electricity production published in 1997) [Brännström-Norberg et al., 1996], [Brännström, 1998] and [Directorate general for energy, 1999]. For the electricity used in other countries (Holland etc.) respective electricity grids [Directorate general for energy, 1999] are used. Some fuels used are derived from Statoil activities in Norway (North-Sea extraction of crude oil, production of fuel...) [Statoil, 1999] Productions and transport: 1. Wetfix I production - Data for the production and the steam used were retrieved from Site Stockvik. 2.1 VEA - The inventory data were given by the competent personnel at the production site. EDC The data were derived from the European average value for the production of Vinyl Chloride Monomer [APME, 1999], with a mass allocation on the products of the process (VCM, ethylene and ethylene dichloride) using the ratio given by the competent personnel at the production site. Ammonia The data are approximated by the European average [APME, 1999]: three plants in France, Germany and in the U.K Nitrogen The data are derived from the inventory for the AGA production in Stenungsund, Sweden with the Dutch electricity average instead of the Swedish values. Sodium Hydroxide

	The data are derived from the inventory for the Akzo Nobel Base production in Bohus, Sweden with the Dutch electricity average instead of the Swedish values. 2.2 TOFA - Data retrieved from the Swedish supplier 2.3 Solvent - Information comes from the supplier 2.4 IPA Data at the plant are given by the competent personnel at the production site in Holland. The propylene production is approximated by the European average data from Austria, Belgium, France, Italy, The Netherlands, Norway, Sweden, Portugal and the UK. [APME, 1999] The electricity production is approximated by the Dutch average electricity grid [Directorate general for energy, 1999] composed of the basic electricity production data from the Vattenfall dataset [Brännström-Norberg et al., 1996]. The steam production is approximated by the data for the on-site steam in the Akzo Nobel plant of Herkenbosch, The Netherlands. 2.5 Nitrogen - Data retrieved from the Swedish supplier 3. Transport data used are for average vehicles [NTM, 2000] The references mentioned above: [APME, 1999] APME - publication of ecoprofiles by Boustead consulting - 1999. [Statoil, 1999] STATOIL - ''Annual Report 1999'' - 1999 - HES Accounting (available on the web)
Notes	The publication reports the results of the study of a system which includes the construction of the asphalt pavement and its maintenance over 40 years. In that system, the adhesion improver Wetfix I is used in the hot mix. Some exact names of raw materials, suppliers and exact transport distances are not shown for reasons of confidentiality. The person stated as Reviewer were the examiner for the Master of Science thesis.

SPINE LCI dataset: Production of Wine Ethanol Fuel (ETAMAX D), excluding grape cultiv. and wine prod.

Administrative	
Finished	Y
Date Completed	1999-01-20
Copyright	
Availability	Public.

Technical System	
Name	Production of Wine Ethanol Fuel (ETAMAX D), excluding grape cultiv. and wine prod.
Functional Unit	1 kg

Functional Unit Explanation	All emissions, resource exploits and energy consummations are based on 1 kg of pure wine ethanol fuel (ETAMAX D).
Process Type	Cradle to gate
Site	Sweden
Sector	Fuel
Owner	Sweden
Technical system description	ETAMAX D is the term used for pure ethanol fuel used for buses in Sweden in 1998. The fuel consists of (in percentage by weight): 95 % Ethanol made from European wine surplus (90,2 %) Beraid 3540 (ignition improver) (7%) Methyl tert-butyl ether (denaturation agent) (2%) Iso-butanol (denaturation agent) (0,5%) Morpholine (corrosion inhibitor) (125 ppm) Distillation of wine to ethanol take place in Italy. The raw ethanol from the distillation is shipped to Sweden (Sekab, Örnsköldsvik) where it is distilled further to reduce its aldehyde and sulphur content. When the concentration of ethanol has reached 95%, the fuel is mixed with the additives. Emissions and energy demands for the following processes are included: -Distillation (the wine is distilled in a one column distillation plant, which requires steam and electricity, partly produced from biogas from the grape shales and branches) -Purification (the raw ethanol is distilled to a higher alcohol concentration, steam and electricity is required for the process) -Production of fuel additives -Combustion of fuel in bus engine (the fuel is combusted in a Scania bus engine, specially developed for ethanol fuel) -Transports (50% filling coefficient) All energy sources are traced back to the extraction of energy raw material. For the processes in Sweden, the petrochemical raw material extraction is assumed to take place in Norway. For raw materials connected to energy use in other countries, a world average is used. The electricity profile is based on the electricity profile for each country respectively. The electricity raw materials are traced back to the extraction in the same way as energy raw material not used for electricity production.

System Boundaries

Nature Boundary	The fact that emissions on different geographical places can have different effects on the environment has not been accounted for. Only CO2 emissions with fossil origin are accounted for. The influence on ground and water is only dealt with in steps where data could be obtained, and are therefore not comprehensive. Only the emissions to air are complete, why these data are the only ones presented.
Time Boundary	All data are for the wine ethanol fuel situation of 1998. Some data were extracted in 1997, but most of them in 1998. Exceptions are energy data which date back to 1993 (energy raw material extraction) and 1995 (electricity profiles).
Geographical Boundary	The study is based on production and consumption of ETAMAX D in Sweden. The ethanol is produced in Italy. All additives are produced in Sweden, except for morpholine, which is not accounted for due to the small amount in the fuel.
Other Boundaries	Subsystems excluded from the system: - environmental influence caused by the production of machines, industrial plants and infrastructure is not included - production and emissions from morpholine (fuel additive) - production and emissions of chemicals used for the distillation process
Allocations	Allocation is made on a mass basis, where allocation has been applied, i.e. cracker product production. The basis for allocation was chosen because it was considered equal in relevance to other possible bases (for example energy basis), but easier to apply. Emissions, resource exploits and energy consumption from the grape cultivation and the wine production are NOT allocated to the wine surplus from which ethanol is made. The motivation is that the surplus would exist irrespectively.

About Inventory

Publication	M. Ericson, G. Odéhn; ''A Life-Cycle Assessment on Ethanol Fuel from Wine''; Akzo Nobel/Chalmers University of Technology; 1999 --- Data documented by: Malin Ericson, Akzo Nobel Surface Chemistry Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology ---
Intended User	Akzo Nobel Surface Chemistry.
General Purpose	The purpose was to study the production of wine ethanol fuel for buses in order to track down where the largest environmental charges could be found. Since the ethanol and the ignition improver are the major components of the fuel, it was of interest to focus on their environmental impact. The commissioner of the study (Akzo Nobel) might have a possibility to affect the production of the ignition improver.
Detailed Purpose	- To identify the environmental impacts of using ethanol fuel for buses, and compare the results to already existing LCA:s on other fuels - To track down the steps in the life-cycle with the largest environmental impacts - To identify the contribution of the ignition improver to the total environmental impacts - To use the results of the study as an indication to where to find improvement possibilities
Commissioner	- Akzo Nobel Surface Chemistry.
Practitioner	Ericson, Malin and Gabriella Odéhn - Akzo Nobel Surface Chemistry.
Reviewer	Ramnäs, Olle - Chalmers University of Technology Department of Chemical Environmental Science
Applicability	The data from the study are applicable for the fuel ETAMAX D, if all the ethanol in the fuel is produced form surplus wine from Italy. It is possible to add emission data from a specific bus driven on ETAMAX D in the purpose of studying the environmental impact from that particular bus. It is also possible to compare the wine ethanol fuel to other fuels. If this is done, the boundaries and allocation methods of the compared studies must be the same as for the wine ethanol fuel study. If the boundaries and allocation differ for different studies, these studies can not be considered comparable.

	It was shown that one of the largest singel environmental impacts of the life-cycle of wine ethanol fuel was the transport of the raw ethanol from Italy to Sweden. Chosing a different transport, for example a boat with cleaning devices for exhaust gas, would strongly affect the result. There are other fuels where wine ethanol is a component, but ETAMAX D is the only pure ethanol fuel in Sweden today (1998). The ethanol in ETAMAX D does not necessarily have to come from wine, though this is the origin of ethanol used in bus fuel at present time.
About Data	All production data have been obtained from technicians or sales managers of the different companies involved. In order to receive reliable data for wine ethanol, several distilleries, wine producers and grape cultivators were visited on the sites of production. Data for the grape cultivation have the highest uncertainties due to the fact that weather conditions and cultivation areas (flat or hilly cultivation) will strongly affect the fertiliser and fuel use. The greater part of all data originates from report to authoroties and environmental reports. An exception is the production of Beraid 3540. During the production of this additive, measurements were carried out on site. Discussions with technicians at Akzo Nobel have been carried out to a greater extent than for other companies involved. Data for electricity, where the electricity have been bought from the state net, is based on the electricity profile for the country in question (profile from 1995). The energy raw materials for electricity production are traced back to the extraction in the same way as for fuels which are not used for electricity production. For petrochemical raw materials used in Sweden, the raw material extraction is assumed to take place in Norway. For petrochemical raw materials used in other parts of the world, a world average is used. Data for transportation are average data for long distance transports in Sweden, applicalble for trucks produced 1995 or later. Since most raw materials are bulk chemicals, quite new catalyst equipped vehicles and empty returns are assumed. For transportations in Italy, older trucks without catalysts are assumed. For the boat transport of raw ethanol from Italy to Sweden, the data were collected from the particular shipping company. The electricity consumption for the system is not displayed in the activity/flow meta data, since electricity is produced within the system and therefore does not represent one of the outflows/inflows from/to the system. However, the consumption of electricity has been calculated to be 0.56 MJ/kg ETAMAX D, from which 0.15 MJ derive from hydro power and 0.12 MJ derive from nuclear power.
Notes	The report on the study of wine ethanol fuel is the result of a Master of Science thesis carried out in co-operation with Akzo Nobel Surface Chemistry and Chalmers University of Technology. Olle Ramnäs, Chalmers University of Technology, who is mentioned as reviewer of the study, was the examiner of the final thesis. The final thesis report comprises a cradle to grave study, not a cradle to gate study, which is the type of study described here. The purpose of excluding the combustion of the fuel here, is to leave the user of the data the possibility to use any emission data from ethanol buses. The report also displays a comparison of wine ethanol fuel to diesel, natural gas and ethanol from wheat and wood.

SPINE LCI dataset: Production of Wine Ethanol Fuel (ETAMAX D), including grape cultiv. and wine prod.

Copyright	
Availability	Public.

Technical System	
Name	Production of Wine Ethanol Fuel (ETAMAX D), including grape cultiv. and wine prod.
Functional Unit	1 kg
Functional Unit Explanation	All emissions, resource exploits and energy consummations are based on 1 kg of pure wine ethanol fuel (ETAMAX D).
Process Type	Cradle to gate

Site	Sweden
Sector	Fuel
Owner	Sweden
Technical system description	ETAMAX D is the term used for pure ethanol fuel used for buses in Sweden in 1998. The fuel consists of (in percentage by weight): 95 % Ethanol made from European wine surplus (90,2 %) Beraid 3540 (ignition improver) (7%) Methyl tert-butyl ether (denaturation agent) (2%) Iso-butanol (denaturation agent) (0,5%) Morpholine (corrosion inhibitor) (125 ppm) Grape cultivation, wine manufacturing and distillation of wine to ethanol take place in Italy. The raw ethanol from the distillation is shipped to Sweden (Sekab, Örnsköldsvik) where it is distilled further to reduce its aldehyde and sulphur content. When the concentration of ethanol has reached 95%, the fuel is mixed with the additives. Emissions and energy demands for the following processes are included: -Harvesting and spreading of fertilisers during the grape cultivation (the grapes are cultivated in northern Italy and most of the harvesting is done by hand, the fertilisers are spread with different types of agricultural machines). -Production of fertilisers (the fertilisers are produced in Italy) -Wine production (only electricity is used for the process which includes all the steps from grinding to barrel packing) -Production of help chemicals for wine production (the chemicals are produced in Italy) -Distillation (the wine is distilled in a one column distillation plant, which requires steam and electricity, partly produced from biogas from the grape shales and branches) -Purification (the raw ethanol is distilled to a higher alcohol concentration, steam and electricity is required for the process) -Production of fuel additives -Combustion of fuel in bus engine (the fuel is combusted in a Scania bus engine, specially developed for ethanol fuel) -Transports (50% filling coefficient) All energy sources are traced back to the extraction of energy raw material. For the processes in Sweden, the petrochemical raw material extraction is assumed to take place in Norway. For raw materials connected to energy use in other countries, a world average is used. The electricity profile is based on the electricity profile for each country respectively. The electricity raw materials are traced back to the extraction in the same way as energy raw material not used for electricity production.

System Boundaries

Nature Boundary	The fact that emissions on different geographical places can have different effects on the environment has not been accounted for. Only CO2 emissions with fossil origin are accounted for. The influence on ground and water is only dealt with in steps where data could be obtained, and are therefore not comprehensive. Only the emissions to air are complete, why these data are the only ones presented.
Time Boundary	All data are for the wine ethanol fuel situation of 1998. Some data were extracted in 1997, but most of them in 1998. Exceptions are energy data which date back to 1993 (energy raw material extraction) and 1995 (electricity profiles).
Geographical Boundary	The study is based on production and consumption of ETAMAX D in Sweden. The ethanol is produced in Italy. All additives are produced in Sweden, except for morpholine, which is not accounted for.
Other Boundaries	Subsystems excluded from the system: - environmental influence caused by the production of machines, industrial plants and infrastructure is not included (- production of pesticides and the emissions from pesticides from the grape cultivation - production and emissions from morpholine (fuel additive) - production and emissions of chemicals used for the distillation process
Allocations	Allocation is made on a mass basis, where allocation has been applied, i.e. on fertiliser production and cracker product production. The basis for allocation was chosen because it was considered equal in relevance to other possible bases (for example energy basis), but easier to apply.

About Inventory

Publication	M. Ericson, G. Odéhn;'' A Life-Cycle Assessment on Ethanol Fuel from Wine''; Akzo Nobel/Chalmers University of Technology; 1999 -- Data documented by: Malin Ericson, Akzo Nobel Surface Chemistry Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	Akzo Nobel Surface Chemistry.
General Purpose	The purpose was to study the production of wine ethanol fuel for buses in order to track down where the largest environmental charges could be found. Since the ethanol and the ignition improver are the major components of the fuel, it was of interest to focus on their environmental impact. The commissioner of the study (Akzo Nobel) might have a possibility to affect the production of the ignition improver.
Detailed Purpose	- To identify the environmental impacts of using ethanol fuel for buses, and compare the results to already existing LCA:s on other fuels - To track down the steps in the life-cycle with the largest environmental impacts - To identify the contribution of the ignition improver to the total environmental impacts - To use the results of the study as an indication to where to find improvement possibilities
Commissioner	- Akzo Nobel Surface Chemistry.
Practitioner	Ericson, Malin and Gabriella Odéhn - Akzo Nobel Surface Chemistry.
Reviewer	Ramnäs, Olle - Chalmers University of Technology Department of Chemical Environmental Science

	Applicability	The data from the study are applicable for the fuel ETAMAX D, if all the ethanol in the fuel is produced form surplus wine from Italy. It is possible to add emission data from a specific bus driven on ETAMAX D in the purpose of studying the environmental impact from that particular bus. It is also possible to compare the wine ethanol fuel to other fuels. If this is done, the boundaries and allocation methods of the compared studies must be the same as for the wine ethanol fuel study. If the boundaries and allocation differ for different studies, these studies can not be considered comparable. It was shown that one of the largest singel environmental impacts of the life-cycle of wine ethanol fuel was the transport of the raw ethanol from Italy to Sweden. Chosing a different transport, for example a boat with cleaning devices for exhaust gas, would strongly affect the result. The high fuel consumption during the grape cultivation is also an important contributing factor for the result, and it must be regognized that grape cultivation probably is carried out in different ways in different parts of the world. There are other fuels where wine ethanol is a component, but ETAMAX D is the only pure ethanol fuel in Sweden today (1998). The ethanol in ETAMAX D does not necessarily have to come from wine, though this is the origin of ethanol used in bus fuel at present time.
	About Data	All production data have been obtained from technicians or sales managers of the different companies involved. In order to receive reliable data for wine ethanol, several distilleries, wine producers and grape cultivators were visited on the sites of production. Data for the grape cultivation have the highest uncertainties due to the fact that weather conditions and cultivation areas (flat or hilly cultivation) will strongly affect the fertiliser and fuel use. The greater part of all data originates from report to authoroties and environmental reports. An exception is the production of Beraid 3540. During the production of this additive, measurements were carried out on site. Discussions with technicians at Akzo Nobel have been carried out to a greater extent than for other companies involved. Data for electricity, where the electricity have been bought from the state net, is based on the electricity profile for the country in question (profile from 1995). The energy raw materials for electricity production are traced back to the extraction in the same way as for fuels which are not used for electricity production. For petrochemical raw materials used in Sweden, the raw material extraction is assumed to take place in Norway. For petrochemical raw materials used in other parts of the world, a world average is used. Data for transportation are average data for long distance transports in Sweden, applicalble for trucks produced 1995 or later. Since most raw materials are bulk chemicals, quite new catalyst equipped vehicles and empty returns are assumed. For transportations in Italy, older trucks without catalysts are assumed. For the boat transport of raw ethanol from Italy to Sweden, the data were collected from the particular shipping company. The electricity consumption for the system is not displayed in the activity/flow meta data, since electricity is produced within the system and therefore does not represent one of the outflows/inflows from/to the system. However, the consumption of electricity has been calculated to be 3.36 MJ/kg ETAMAX D, from which 0.96 MJ derive from hydro power and 0.76 MJ derive from nuclear power.
	Notes	The report on the study of wine ethanol fuel is the result of a Master of Science thesis carried out in co-operation with Akzo Nobel Surface Chemistry and Chalmers University of Technology. Olle Ramnäs, Chalmers University of Technology, who is mentioned as reviewer of the study, was the examiner of the final thesis. The final thesis report comprises a cradle to grave study, not a cradle to gate study, which is the type of study described here. The purpose of excluding the combustion of the fuel here, is to leave the user of the data the possibility to use any emission data from ethanol buses. The report also displays a comparison of wine ethanol fuel to diesel, natural gas and ethanol from wheat and wood.

SPINE LCI dataset: Production of wood

	Administrative	
	Finished	Y
	Date Completed	02-12-31
	Copyright	
	Availability	Public

Technical System	
Name	Production of wood
Functional Unit	1 kg wood.
Functional Unit Explanation	1 kg wood for package use in Sweden
Process Type	Gate to gate
Site	Sweden
Sector	Materials and components
Owner	Sweden
Technical system description	This activity describes a process step included in the system ''Production of plywood boxes'', also available in the SPINE@CPM database. Plywood boxes are used to pack the coated and non-coated roller bearings from SKF, Göteborg, during the transportation to customers. The plywood boxes are manufactured by Nefab Emballage AB in Alfta, Sweden. The plywood box consist of plywood, steel strips, steel nails and wooden splits. Wooden splits are attached to the bottom of the box to enable forklift handling. Nefab Emballage AB buys the wooden splits from a local sawmill, Alfta Pall AB, in Alfta, Sweden. This dataset describes the production of wood for the wooden splits. The database in LCAiT - production of 1 kg of wood for package use in Sweden - is used [Tillman et al., Chalmers Industriteknik, Gothenburg, Sweden, 1992. Packaging and the Environment, Tillman et al., Chalmers Industriteknik, Gothenburg, Sweden, 1992.]. The data includes transports and extraction of raw material.

System Boundaries	
Nature Boundary	Emissions to air and water are included.
Time Boundary	The analysis is performed during autumn 1992.
Geographical Boundary	Sweden
Other Boundaries	Emissions fom combustion of fuels and from the production of electricity are already included in the results from this file. The electricity is accounted for as ''Electricity, Swedish average'' The dataset is including transports and extraction of raw materials. Note that all the energy carriers (presented in MJ in the inventory profile) are ''internal parameters'' i.e. they are already presented as primary resources in gram.
Allocations	Allocations have been made according to weight.
Systems Expansions	Not applicable

Flow Data	
General Activity QMetaData	
Date Conceived	02-08-01 - 02-12-31
Data Type	Derived, mixed
Represents	Flows to and from nature for a cradle to gate inventory of 1 kg of Wetfix I.
Method	The data set is obtained from an earlier LCA study by Packforsk Consulting AB. The analysis is based on information from Packaging and the Environment, Tillman et al., Chalmers Industriteknik, Gothenburg, Sweden, 1992. The analysis is performed by Tomas Ekvall, Elin Eriksson , Mikael Kullman and Göran Svensson, Chalmers Industriteknik, Gothenburg, Sweden, autumn 1992.
Literature Reference	* The analysis is based on information from Packaging and the Environment, Tillman et al., Chalmers Industriteknik, Gothenburg, Sweden, 1992. The analysis is performed by Tomas Ekvall, Elin Eriksson , Mikael Kullman and Göran Svensson, Chalmers Industriteknik, Gothenburg, Sweden, autumn 1992. * Simplified life cycle assessment for the comparison

	of two packaging alternatives for medium-sized roller bearings; April 2001; Pär Weström at Packforsk Consulting AB; Report no. C00 528.
Notes	For 1 kg of hot mix, 0,24 g of Wetfix I are required according to the maximum dosage. For the amount of hot mix required for 1km of road, refer to the ''Functional unit explenation'' in the technical system.

About Inventory

Publication	Master thesis: LCA based solution selection; Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ------------ Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.
Intended User	Product developers at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. Both types of bearings are packed in a plywood box. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.

Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Helene Berg - .
Reviewer	Olle Ramnäs -
Applicability	The data is valid for production of wood for package use in Sweden.
About Data	The analysis is based on information from Packaging and the Environment, Tillman et al., Chalmers Industriteknik, Gothenburg, Sweden, 1992. The analysis is performed by Tomas Ekvall, Elin Eriksson , Mikael Kullman and Göran Svensson, Chalmers Industriteknik, Gothenburg, Sweden, autumn 1992.

SPINE LCI dataset: Production of wood Adhesive PVAC 3316

Administrative	
Finished	Y
Date Completed	2000-02-24
Copyright	Casco Products
Availability	Public

Technical System	
Name	Production of wood Adhesive PVAC 3316
Functional Unit	1 kg dry wood adhesive PVAC 3316
Functional Unit Explanation	All emissions, use of resourses and energy consumption is based on 1 kg dry wood adhesive PVAC 3316 (Cascol 3316). The adhesive is delivered with 47% dry content. As an average 57 g of package material per kg dry adhesive is delivered.
Process Type	Cradle to gate
Site	Europe
Sector	
Owner	Europe
Technical system description	Wood Adhesive PVAC 3316 (Cascol 3316) is a formulation of polyvinylacetate, filler, solvent and additives. The adhesive is produced by Casco Products, Sweden. It is delivered in disposable containers (polyethylene/steel), polyethylene pails or polypropylene drums. The production of the main raw materials is described below: 1. Natural gas production: The study includes winning, delivery to shore and storage. Natural gas is used in the production of raw materials for polyvinylacetate dispersion and solvent. 2. Crude oil production. The study includes winning, delivery to shore ans storage. Crude oil is used in the production ofraw materials for polyvinylacetate dispersion and solvent. 3. There are various processes to produce acetylene and acetic acid, the main raw materials for vinylacetate production. It is not known which processes that are used in this case. 4. Vinylacetate is polymerised to polyvinylacetate with the help of radical forming catalysts. The temperature is often 70-80°C. In this case an emulsion polymerisation in the presence of wetting agent, protective colloides and catalyst is made. 5. Limestone is extracted from the earth, grind and sieved according to the specification for the filler. Extraction an transports are accounted for. 6. Detailes of the process used for the solvent is not known. 7. The PVAc dispersion, filler , solvent and other additives are mixed together at Casco Products' Decorative Coatings' factory in Kristinehamn, Sweden.

	Overall information: Transports are included in the system.

System Boundaries

Nature Boundary	All emissions are considered equivalent, independently of where they take place (locally, regionally, globally , in densly populated areas or rural areas) The emissions presented were chosen as relevant for the product type. Most of the used data are measured, some estimated.
Time Boundary	Most of the process data for the raw materials are valid for 1997, beeing yearly averages where possible. No great changes after that are estimated. The data from Decorative Coatings factory in Kristinehamn are from 1998.
Geographical Boundary	The production of the raw materials is made on different sites in Europe. TheMixing of the raw materials is made at Decorative Coatings' factory, Kristinehamn, Sweden.
Other Boundaries	An average of the packages for the product is included in this study. The transportation to the users, use and final desposal of theadhesive is not included. The environmental effects associated with the manufacture of capital equipement and with energy and fuel requirements for plant and buildings conditioning (heat, air, etc) were not included, neither were those associated with personnel requirements. Water consumption was not included.
Allocations	Emissions and waste at the Decoraitve Coatings facory in Kristinehamn where the final mixing of teh raw materials is done are allocated on a mass basis among the products that may cause them. Energy required to heat storage buildings, etc is allocated on a mass basis among the products that are stored there.

About Inventory

Publication	-- Data documented by: Birgit Nilsson, Casco Products, Sweden Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden Published in SPINE@CPM: 7 August 2001 --
Intended User	Users of PVAc wood adhesive Ca
General Purpose	
Detailed Purpose	To provide LCI data to producers of carpentry, furniture and other wood products where PVAc wood adhesives are used.
Commissioner	- Casco Products Box 11538, S-10061 Stockholm, Sweden .
Practitioner	Nilsson, Birgit - Casco Products Box 11538, S-10061 Stockholm, Sweden .
Reviewer	
Applicability	Wood adhesive Cascol 3316 is suitable forveneering and jointing in hot-and cold press. It should always be used for indoor purposes. Data describing two other PVAC wood adhesives produced by Casco Products is available in the database; PVAC 3318 and PVAC 3326. More information about adhesives can be given

	by Casco Products, phone no 46 8 743 4000.
About Data	For the final production of wood adhesive 3316 all data originates from Decorative Coatings factory in Kristinehamn. For raw materials and auxilary materials suppliers have participated on terms that their data will be treated confidentially. For the production of polyvinylacetate cradle to gate data wer provided, for vinylacetate monomer , filler, solvent and additives cradle to gate data. For fuel data from APME Ecoprofiles are used.. Raw materials used are mentioned under ''Object of study/Functions) Overall information: Transports are included in the system. The fuels for the transports are traced back to the extraction of petrochemical raw materials and the extraction of bio fuels. The electricity data are based on the electricity profiles for each country . For coal, lignite and natural gas data from ETH,Switzerland have been used. For other kinds of energy data from Vattenfall, Sweden have been used. These are combined into energy mixes for different countries according to statistics of 1995 from ''Annual Energy Review 1997'' (European comission) Building of the power plant is not included.

Name	Production of wood Adhesive PVAC 3318
Functional Unit	1 kg dry wood adhesive PVAC 3318
Functional Unit Explanation	All emissions, use of resourses and energy consumption is based on 1 kg dry wood adhesive PVAC 3318 (Cascol 3318). The adhesiver is delivered with 47% dry content. As an average 97 g of package material per kg dry adhesive is delivered.
Process Type	Cradle to gate
Site	Europe
Sector	
Owner	Europe
Technical system description	Wood Adhesive PVAC 3318 (Cascol 3318) is a formulation of polyvinylacetate, fillers, solvent and additives. The adhesive is produced by Casco Products, Sweden. It is delivered in disposable containers (polyethylene/steel), polyethylene pails or polypropylene drums. The production of the main raw materials is described below: 1. Natural gas production: The study includes winning, delivery to shore and storage. Natural gas is used in the production of raw materials for polyvinylacetate dispersion and solvent. 2. Crude oil production. The study includes winning, delivery to shore and storage. Crude oil is used in the production of raw materials for polyvinylacetate dispersion and solvent. 3. There are various processes to produce acetylene and acetic acid, the main raw materials for vinylacetate production. It is not known which processes that are used in this case. 4. Vinylacetate is polymerised to polyvinylacetate with the help of radical forming catalysts. The temperature is often 70-80°C. In this case an emulsion polymerisation in the presence of wetting agent, protective colloides and catalyst is made. 5. Limestone is extracted from the earth grind and sieved according to the specifications of the filler. Extraction an transports are accounted for. 6. Detailes of the process used for the solvent is not known.

	7. The PVAc dispersion, filler , solvent and other additives are mixed together at Casco Products Decorative Coatings' factory in Kristinehamn, Sweden. Overall information: Transports are included in the system.

System Boundaries

Nature Boundary	All emissions are considered equivalent, independently of where they take place (locally, regionally, globally , in densly populated areas or rural areas) The emissions presented were chosen as relevant for the product type. Most of the used data are measured, some estimated.
Time Boundary	Most of the process data for the raw materials are valid for 1997, beeing yearly averages where possible. No great changes after that are estimated. The data from Decorative Coatings factory in Kristinehamn are from 1998.
Geographical Boundary	The production of the raw materials is made on different sites in Europe. The mixing of the raw materials is made at Decorative Coatings' factory, Kristinehamn, Sweden.
Other Boundaries	An average of the packages for the product is included in this study. The transportation to the users, use and final desposal of theadhesive is not included. The environmental effects associated with the manufacture of capital equipement and with energy and fuel requirements for plant and buildings conditioning (heat, air, etc) were not included, neither were those associated with personnel requirements. Water consumption was not included.
Allocations	Emissions and waste at the Decoraitve Coatings facory in Kristinehamn where the final mixing of teh raw materials is done are allocated on a mass basis among the products that may cause them. Energy required to heat storage buildings, etc is allocated on a mass basis among the products that are stored there.
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1998
Data Type	Derived, unspecified
Represents	Flows to and from nature for a cradle to gate inventory of 1 kg of Wetfix I.
Method	Accounted as an inventory profile. Data from suppliers and litterature were used. For emission and waste data in our own factory data were taken from Environmental report 1998 and ProduktionsStatistics 1998. Allocations were made on mass basis.
Literature Reference	
Notes	For 1 kg of hot mix, 0,24 g of Wetfix I are required according to the maximum dosage. For the amount of hot mix required for 1km of road, refer to the ''Functional unit explenation'' in the technical system.

About Inventory

Publication	-- Data documented by: Birgit Nilsson, Casco Products, Sweden Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden Published in SPINE@CPM: 7 August 2001 --
Intended User	Users of PVAc wood adhesive Ca
General Purpose	
Detailed Purpose	To provide LCI data to producers of carpentry, furniture and other wood products where PVAc wood adhesives is used.
Commissioner	- Casco Products Box 11538, S-10061 Stockholm, Sweden .
Practitioner	Nilsson, Birgit - Casco Products Box 11538, S-10061 Stockholm, Sweden .
Reviewer	
Applicability	Wood adhesive Cascol 3318 is suitable for jointing in hot-and high frequency press. It should always be used for indoor purposes. Data describing two other PVAC wood adhesives produced by Casco Products is available in the database; PVAC 3316 and PVAC 3326. More information about adhesives cn be given by Casco Products 46 8 743 4000.

About Data	For the final production of wood adhesive 3318 all data originates from Decorative Coatings factory in Kristinehamn. For raw materials and auxilary materials suppliers have participated on terms that their data will be treated confidentially. For the production of polyvinylacetate cradle to gate data wer provided, for vinylacetate monomer , filler, solvent and additives cradle to gate data. For fuel data from APME Ecoprofiles are used. Raw materials used are mentioned under ''Object of study/Functions) Overall information: Transports are included in the system. The fuels for the transports are traced back to the extraction of petrochemical raw materials and the extraction of bio fuels. The electricity data are based on the electricity profiles for each country . For coal, lignite and natural gas data from ETH,Switzerland have been used. For other kinds of energy data from Vattenfall, Sweden have been used. These are combined into energy mixes for different countries according to statistics of 1995 from ''Annual Energy Review 1997'' (European comission) Building of the power plant is not included.

Availability	Public

Technical System	
Name	Propane fired combination plant for heat and power production
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of resources and raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in a propane fired plant for heat and power production in Sweden. The plant is combined with one gas turbine and one steam turbine with a common generator and a waste heat boiler. The heat is delivered to a district heating net. Production of materials, chemicals, electricity and transport used in association with the fuel chain and the operation and maintenance of the plant are not included. TECHNICAL DATA FOR THE STUDIED PLANT: Average annual time of use (hours): 1 682 Total electric power output (MW): 30 Total thermal output (MW): 32 Annual total fuel use (MWh): 104 716 Normal annual production of heat (MWh): 44 337 Normal annual production of electricity (MWh): 41 190 Degree of efficiency (%): 82 PROCESS DESCRIPTION: The unit consists of one propane fired gas tubine and one steam turbine with a common generator and a waste heat boiler for steam production. The maximum thermal output is 32 MW. The heat is delivered to a district heating net. INCLUDED OPERATIONS: The process study consists of the following operations: - The feeding of the propane into the combustion process. - The combustion process.

	- The production of heat. - The internal consumption of electricity. - The NOx control system. NOx CONTROL: The combustion chamber is equiped with a low-NOx-burner to minimize the emissions of NOx. OTHER FLUE GAS CLEANING SYSTEMS: Propane leaves no sulphur oxides or dust as emissions and therefore no cleaning of the flue gas is done.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are normally measured and reported once yearly in a public environmental report. According to experience the emission of HC are close to zero (not measurable) when propane is fired.
Time Boundary	APPLICABLE TIME OF SYSTEM: This inventory was conducted using data from 1996. The data consists of average data on a year basis. This data is assumed to be valid until new national or local regulations are enforced in Sweden.
Geographical Boundary	GEOGRAPHICAL EXTENSION: This inventory has been conducted on a propane fired plant for heat production in Sweden, with swedish regulations, applicable during 1996. The collected data should only be used for swedidh conditions.
Other Boundaries	NOTES OF EXCLUDED TECHNICAL SYSTEMS: The following operatios have been excluded from the system: - The distribution of district heat from the plant to the consumers. - Building of the plant, the district heating net or the electricity supply system. - The cradle to gate of the internal electricity consumption. - The production of propane. - The transportation of propane to the plant. EXCLUDED FLOWS - The chemicals used for feed water treatment. - The water consumption in the process.
Allocations	PRINCIPLE APPLIED: In a combined power and heating plant two products of economic value are produced. For operation and maintenance of the plant the use of resources and the emissions are associated in relation to the net production of heat and power respectively. For the use of resources and emission that are specific for the electric power production are allocated to that production. Equivalent to this the use of resources and emissions specific for heat production are allocated to that production. Note: When both heat and power are produced the allocation between the products are the same. That is the environmental load for 1 kWh produced heat are the same as for 1 kWh produced electrical power. DESCRIPTION:
Systems Expansions	N/A

Flow Data

General Activity QMetaData

Date Conceived	1996
Data Type	
Represents	Flows to and from nature for a cradle to gate inventory of 1 kg of Wetfix I.
Method	All data reported are related to the functional unit 1 kWh heat produced and delivered. The data is originally given as the total yearly amount of an input (fuel, electericity) to or an output (emission, product) from the energy plant. The inputs and outputs are the related to the functional unit by deviding the total yearly amount with the yearly amount of produced heat and multiplying with the fraction of the total production that are associated with the heat production. For some flows specific information is given, see each flow.
Literature Reference	Data are in general recieved from ''Miljörapport 1996, Karlskoga Kraftvärmeverk AB''.
Notes	The parameters presented are chosen because they are available in the annual environmental report of the plant. Data can be missing if it is not reported in the report. The type of data reported is governed by the inspection authority. All values are reported with 3 figures. Data are however seldom that accurate.

Flow Table and Specific Meta Data

QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
Method: Not known.	Input	Refined resource	Electricity	0.00118			kWh	Technosphere	
Method: The consumed amount for the year.	Input	Refined resource	Propane	97.1			g	Technosphere	
Data type: Monitored data, continuous Method: This emission is measured continously. Literature: Miljörapport 1996, Karlskoga Kraftvärmeverk AB	Output	Emission	CO	0.0957			g	Air	
Method: The yearly amount of this emission was estimated by using the standard value for CO2-emissions from plants fired with propane, according to NUTEK. The standard value for propane is 65 g/MJ fuel.	Output	Emission	CO2	253			g	Air	
Notes: No dust is emitted from the combustion of propane.	Output	Emission	Dust	0			g	Air

About Inventory

Publication	LCA värme, Vattenfalls Livscykelanalyser, Produktion av värme; Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius; SwedPower AB, Miljö & Kvalitet; 1999-07-01. -- Data documented by: Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders at SwedPower AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	Intended users of the data are
General Purpose	The general purpose of the inventory was to obtain a lifecycle inventory of heat producing plants using different types of fuels. A further purpose was to obtain data from heat producing plants with different capacities.
Detailed Purpose	The specific purpose was to compare data from plants producing heat, with various fuels, combustion technologies and flue gas cleaning systems.
Commissioner	Bodlund, Birgit - Vattenfall AB.
Practitioner	- SwedPower AB, Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders .
Reviewer	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
Applicability	CERTAIN CAUTIONS: This inventory has been conducted on a propane fired plant for heat production in Sweden, with swedish regulations, applicable during 1996. This data is assumed to be valid until new national or local regulaitons are enforced in Sweden. The collected data should only be used on plants producing heat in Sweden and for swedish conditions. When both heat and power are produced the allocation between the products are the same. That is the environmental load for 1 kWh produced heat are the same as for 1 kWh produced electrical power.
About Data	GENERAL DATA SOURCE DESCRIPTION: Data quality in the meaning good precision for the operation of the plant concerning for example the precision of emission measurements, calibration of instruments are good for plants larger than 10 MW and/or plants with a production larger than 25 GWh/year. These plants are included in the NOx control system . At these plants the instruments for NOx-control and calculations are controlled every year at the periodical inspection. Most larger plants are also calibrating other instruments in there own intrerest or as a consequence of an internal control program.

Method: The yearly amount of this emission was estimated by using the standard value for CO2-emissions from plants fired with propane, according to NUTEK. The standard value for propane is 65 g/MJ fuel.	Output	Emission	CO2	253			g	Air	
Notes: No dust is emitted from the combustion of propane.	Output	Emission	Dust	0			g	Air	
Data type: Monitored data, continuous Method: This emission is measured continously. Literature: Miljörapport 1996, Borås Energi AB	Output	Emission	NOx	0.205			g	Air	
Notes: Propane contains no sulphur.	Output	Emission	SO2	0			g	Air	
Method: Not known.	Output	Product	Heat	1			kWh	Technosphere	

About Inventory

Publication	LCA värme, Vattenfalls Livscykelanalyser, Produktion av värme; Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius; SwedPower AB, Miljö & Kvalitet; 1999-07-01. -- Data documented by: Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders at SwedPower AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	Intended user of the data are
General Purpose	The general purpose of the inventory was to obtain a lifecycle inventory of heat producing plants using different types of fuels. A further purpose was to obtain data from heat producing plants with different capacities.
Detailed Purpose	The specific purpose was to compare data from plants producing heat, with various fuels, combustion technologies and flue gas cleaning systems.
Commissioner	Bodlund, Birgit - Vattenfall AB.
Practitioner	- SwedPower AB, Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders .
Reviewer	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
Applicability	CERTAIN CAUTIONS: This inventory has been conducted on a propane fired plant for heat production in Sweden, with swedish regulations, applicable during 1996. This data is assumed to be valid until new national or local regulations are enforced in Sweden. The collected data should only be used on plants producing heat in Sweden and for swedish conditions.
About Data	GENERAL DATA SOURCE DESCRIPTION: Data quality in the meaning good precision for the operation of the plant concerning for example the precision of emission measurements, calibration of instruments are good for plants larger than 10 MW and/or plants with a production larger than 25 GWh/year. These plants are included in the NOx control system . At these plants the instruments for NOx-control and calculations are controlled every year at the periodical inspection. Most larger plants are also calibrating other instruments in there own interest or as a consequence of an internal control program.

Technical System	
Name	Propane fired plant for heat production - Small plant
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of resources and raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden

Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in a propane fired plant for heat production in Sweden. The plant consists of three hot water boiler units. The heat is delivered to a district heating net. Production of materials, chemicals, electricity and transport used in association with the fuel chain and the operation and maintenance of the plant are not included. TECHNICAL DATA FOR THE STUDIED PLANT: Average annual time of use (hours): - Total thermal output (MW): 5+5+10 Annual total fuel use (MWh): 64 388 Normal annual production of heat (MWh): 59 646 Degree of thermal efficiency (%): 92,6 PROCESS DESCRIPTION: The plant consists of three hot water boiler units, two of 5 MWh thermal output and one of 10 MWh thermal output. The propane is incinerated in the boilers. Hot water is produced and transmitted into heat for the district heating net. Oil is used as reserve fuel, but is not included in this system. INCLUDED OPERATIONS: The process study consists of the following operations: - The feeding of the propane into the combustion process. - The combustion process. - The production of heat. - Internal consumption of electricity. NOx CONTROL: The boilers are not equiped with any NOx control system. OTHER FLUE GAS CLEANING SYSTEMS: Propane leaves no sulphur oxides or dust as emissions and therefore no cleaning of the flue gas is needed.

System Boundaries	
Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are normally measured and reported once yearly in a public environmental report. According to experience the emission of HC are close to zero (not measurable) when propane is fired.
Time Boundary	APPLICABLE TIME OF SYSTEM/PRODUCT: This inventory was conducted using data from 1996. The data consists of average data on a year basis. This data is assumed to be valid until new national or local regulations are enforced in Sweden.
Geographical Boundary	GEOGRAPHICAL EXTENSION: This inventory has been conducted on a propane fired plant for heat production in Sweden, with swedish regulations, applicable during 1996. The collected data should be used for swedish conditions.
Other Boundaries	NOTES OF EXCLUDED TECHNICAL SYSTEMS: The following operations has been excluded from the system: - The use of reserve fuel (oil). - The distribution of district heat from the plant to the consumers. - Building of the plant, the district heating net and the electricity supply system. - The cradle to gate of the internal electricity consumption. - The production of propane. - The transport of propane to the plant. EXCLUDED FLOWS - The chemicals used for feed water treatment. - The water consumption in the process.
Allocations	PRINCIPLE APPLIED: In a heating plant one product of economic value are produced. For operation and maintenance of the plant the use of resources and emissions are associated to the net production of heat. DESCRIPTION:
Systems Expansions	N/A

Flow Data	
General Activity QMetaData	
Date Conceived	1996
Data Type	
Represents	Flows to and from nature for a cradle to gate inventory of 1 kg of Wetfix I.

Method	All data reported are related to the functional unit 1 kWh heat produced and delivered. The data is originallty given as the total yearly amount of an input (fuel, electricity) to or an output (emission, product) from the energy plant. The inputs and outputs are then related to the functional unit by dividing the total yearly amount with the yearly amount of produced heat. For some flows specific information is given, see each flow.
Literature Reference	Data is in general recieved from ''Miljörapport 1996, Ludvika Värme AB''.
Notes	The parameters presented are chosen because they are available in the annual environmental report of the plant. Data can be missing if it is not reported in the report. The type of data reported is governed by the inspection authority. All data are reported with 3 figures. The data are however seldom that accurate.

Technical System	
Name	Pulverized wood fired plant for heat and power production - Large plant
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of resources and raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in a pulverized wood fired plant for heat and power production located in Sweden. The heat is delivered to a district heating net. Production of materials, chemicals, electricity and transport used in association with the fuel chain and the operation and maintenance of the plant are not included. TECHNICAL DATA FOR THE STUDIED PLANT: Average annual time of use (hours): 4960 Total electric power output (MW): 8,7 Total thermal output (MW): 68 Annual total fuel use (MWh): 340 000 Normal annual production of heat (MWh): 285 152 Normal annual production of electricity (MWh): 27 947 Degree of thermal efficiency (%): 92 PROCESS DESCRIPTION: The plant consists of two boiler units with a common steampipe line. The boilers are fired with pulverized wood and oil respectively. Only the boiler fired with wood is included in this study. The production from wood is 75 % of the total annual production from the plant. Only the part that can be referred to the pulverized wood incineration are presented above. ROFA (rotating overfired air). The ROFA system has been installed in order to improve the efficiency and to decrease the NOx emission. The dust is removed from the flue gas in an electrostatic precipitator. INCLUDED OPERATIONS: The process of study consists of the following operations: - The feeding of the pulverized wood into the combustion process. - The combustion process. - The removal of dust from the flue gas in the electrostatic precipitator. - The internal treatment of the residues from the combustion process. - The internal consumption of electricity. - The internal consumtion of chemicals for the feed water treatment. - The NOx control system NOx CONTROL: In the pulverized wood fired plant the overfire air is provided by the technique ROFA (rotating overfire air) which gives a better mixing of the air, leading to a better combustion. OTHER FLUE GAS CLEANING SYSTEMS: - For the removal of dust from the flue gas an electrostatic precipitator is used. In an electrostatic precipitator the dust particles are electrified and then separated from the flue

	gas stream by passing through an electric field with largest possible intensity. - Due to the low sulphur content in wood fules, no reduction of the sulphur content in the flue gas is needed.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are normally measured and reported in a public environmental report. The emission of HC is not measured.
Time Boundary	APPLICABLE TIME OF SYSTEM: This inventory was conducted using data mainly from 1996. The data consists of average data on a year basis. This data is assumed to be valid until new national or local regulations are enforced in Sweden.
Geographical Boundary	GEOGRAPHICAL EXTENSION: This inventory has been conducted on a pulverized wood fired plant for heat and power production in Sweden, with swedish regulations, applicable during 1996. The collected data should be used for swedish conditions.
Other Boundaries	NOTES OF EXCLUDED TECHNICAL SYSTEMS: The following operations have been excluded from the system: - The distribution of district heat from the plant to the consumers. - Building of the plant and the district heating net. - The cradle to gate of the internal electricity consumption. - The production of the pulverized wood fuel. - The transportation of the fuel to the plant. - The transportation of the residues from the combustion and cleaning processes to the landfill or back to the forest. - The processes at the landfill such as leaching, decomposition etc. - The spreading of the ashes in the forest. EXCLUDED FLOWS - The water consumption in the process.
Allocations	PRINCIPLE APPLIED: In a combined power and heating plant two products of economic value are produced, heat and electrical power. For operation and maintenance of the plant the use of resources and the emissions are associated in relation to the net production of heat and power respectively. For the use of resources and the emissions that are specific for the electrical power production are allocated to that production. Equivalent to this the use of resources and the emissions specific for the heat production are allocated to that production. Note: When both heat and power are produced the allocation between the products are the same. That is the environmental load for 1 kWh produced heat are the same as for 1 kWh produced electrical power. DESCRIPTION:

Technical system description	These are the different production steps. (1) The starting raw materials for PVC production are crude oil and/or natural gas and sodium chloride. (2) The hydrocarbon raw materials are converted to ethene and sodium chloride is electrolysed to produce chlorine. (3) The ethene and chlorine are reacted to produce 1,2-dichloroethane. This latter is then decomposed by heating in a high temperature furnace to obtain vinyl chloride.

	(4) A simple process of polymerisation is then obtained to get PVC.

About Inventory

Publication	Eco-profiles of the European polymer industry APME technical Report 6 : Polyvinyl chloride April 1994 -- Data documented by: Sophie Louis, Volvo Technical Development Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	APME's eco-profiles serve two
General Purpose	Production process Data averaged over all polymerisation processes APME [The Association of plastic Manufacturers in Europe] members in Western Europe wanted to provide public ''Cradle to the gate data'' concerning their product's life-cycle.
Detailed Purpose	The aim here is to provide ''cradle to gate'' data for the manufacturing of PVC (all polymersiation processes included)
Commissioner	- APME, Avenue E. Van Nieuwenhuyse 4 Box 3 B-1160 Brussels.
Practitioner	Boustead, Ian Dr - .
Reviewer	
Applicability	Data averaged over all polymerisation processes
About Data	All operations up to the production of the polymer resin are covered. Any subsequent processes, such as compounding, which are carried out prior to conversion are excluded.
Notes	Ethylene production When the plant supplying with ethylene a specific site is known, then the specific data have been used. When, however the source of ethylene is not known or where the ethylene is drawn from the European pipeline, average pipeline have been used. Two sets of average data have been used for ethylene ; the results relevant to the European pipeline and the European average ; these data are extracted from a previous APME report called Eco-profile of the European Plastic Industry. Report 2 : Olefin Feedstock Sources. European Centre for Plastics in the Environment, Brussels. May 1993 Sources of sodium chloride Two methods for extracting sodium chloride exist : · brine pumping : water is pumped into a natural salt deposit when the salt dissolves to produce a saturated solution which may be pumped to the surface to be used ; · rock salt mining Here, data have been obtained for the mining of 415 000 tonnes of rock salt and the brine pumping of some 4,1 million tonnes of sodium chloride Chlorine production Chlorine is produced by the electrolysis of an aqueous solution of sodium chloride. Data have obtained from 14 chlorine plant which between them produce some 2,4 million tonnes of chlorine. Production of vinyl Chloride Monomer The production of VCM from ethylene and chlorine form a single plant and it is usually impossible to separate the operation of individual unit processes. Data have been obtained

	on the operation of this overall VCM unit from 10 plants which between them produce some 3,5 million of tonnes of VCM each year. PVC production Vinyl Chloride monomer is polymerised to PVC by three main methods : suspension polymerisation ; emulsion polymerisation and bulk polymerisation. Data havebeen obtained from a total of 14 polymerisation plants which annually produce some 2,2 million toones of PVC. Eight plant were using the suspension process and were producing some 1,6 million tonnes of PVC, five plants using em,ulsion polymerisation and producing some 400 000 tonnes of PVC and a single bulk polymerisation plant producing 165 000 tonnes of PVC.

SPINE LCI dataset: Rail transport - 10 trucks

Administrative	
Finished	Y
Date Completed	1993-01-01
Copyright	
Availability	Public

Technical System	
Name	Rail transport - 10 trucks
Functional Unit	tonkm, 80 %
Functional Unit Explanation	The energy use is calculated with reference to the transportation of 1 ton goods, 1 kilometre for an utilisation level of 80%.
Process Type	Unit operation
Site	Sweden
Sector	Land transport
Owner	Sweden
Technical system description	Operation of an electrically driven engine with 10 trucks.

System Boundaries	
Nature Boundary	
Time Boundary	The aim was that the data should be representative for 1992.
Geographical Boundary	Sweden and other countries with a similar rail system.
Other Boundaries	Utilisation level with regard to weight: 80%. The energy use are only associated with the propulsion of the train *Not included in the system* Production and distribution of electricity Production and maintenance of the train and tracks
Allocations	
Systems Expansions	

Flow Data	
General Activity QMetaData	
Date Conceived	1979-1984
Data Type	Unspecified

Represents	These average values are based on three different types of the polymerisation of vinyl chloride monomer : - suspension polymerisation [14 plants in Europe] - emulsion polymerisation [5 plants in Europe] - bulk polymeriastion.
Method	The electricity use of 10 trucks with an average load factor of 80 % can be read in figure 2.3, page 11, Backman et al. Figure 2.3 shows the electricity use as a function of load (25 -100% of total load capacity). The energy use for propulsion are measured at the primary side of the converter station (50 Hz, 3-phase, 6.3 kV). The energy use to reverse the points are included as an average addition of 6 % to the energy use. The background for figure 2.3 can be found in Backman et al (2). It is however not stated in Backman et al (2) how the background material was retrieved.
Literature Reference	1. Backman, H., and Cordi, I. \`Energieffektivitet i framtidens godstransporter\` Transportforskningsdelegationen 1984:1 2. Cordi, I et al, \`Energieffektiviteten för person- och godstransporter i Sverige. En jämförande analys. Appendix.\` TFD-rapport 1979:2, Transportforskningsdelegationen, 1979
Notes	National values for environmental loadings for electricity production can be linked to the electricity use.

About Inventory

Publication	Lenner, M. \`Energiförbrukning och avgasemission för olika transporttyper\` VTI-meddelande nr 718, Statens Väg- och Trafikinstitut, 1993 -- Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	The Swedish Environmental Prot
General Purpose	To *facilitate a comparison* between energy use and environmental load for different types of transports.
Detailed Purpose	To compile data for current and future energy and exhaust emissions for different types of transports.
Commissioner	- The Swedish Environmental Protection Agency.
Practitioner	Lenner, Magnus - Väg- och transportforskningsinstitutet 581 95 Linköping .
Reviewer	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
Applicability	The data are only applicable for a goods train with 10 trucks, with average utilisation level of 80% of the available loading capacity. Lenner states that an average utilisation level of 40 % is stated by several sources in the literature while SJ maintains that the average use due to greater efficiency in recent years has been increased to over 80%. National values for environmental loadings for electricity production can be linked to the electricity use. The electricity use for goods transport by train is not expected to decrease. A minor reduction of losses can be obtained by replacement of old transformers and converters (the main losses are transmission, conversion and transformation losses).
About Data	The data were collected in the late 1970s, but are still assumed to be representative.
Notes	Lenners values are also used in: Tillman, A-M. \`Goods transportation in life cycle assessment. Standard values for energy consumption and emissions.\` In: Life Cycle Assessment - Inventory Analysis Methodology: Overview, Recycling, Electricity and Transports, Swedish Waste Research Council (AFR) report nr 74, April 1995

General Purpose	Excerpt from the report, see 'Publication': ''The overall aim of the study is to assess the potential environmental impacts of substituting animal protein for regionally grown vegetable protein in food products.''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The objective is to analyze three food products of the same type, and the purpose is to compare the environmental impact of the products and also to identify the most important contributors of the total environmental impact of each product. The products are described as follows. - a product in which all protein is animal protein. - a product in which 10% of the animal protein is replaced with vegetable protein. - a product in which all protein is vegetable protein. Furthermore, the objective is to provide useful information on the products that can be used in other environmental systems analysis, e.g. in meal studies.

Technical System

Name	Rapeseed lubricant
Functional Unit	910 kg of rapeseed lubricant
Functional Unit Explanation	910 kg was the amount that theUnspecified rapeseed lubricant.
Process Type	Cradle to grave
Site	Sweden
Sector	Process
Owner	Sweden
Technical system description	The activity contains cultivation of rapeseed, production of lubricant, transports as well as combustion of waste oil. The data set is compiled for a case study of the effect of environmentally friendly lubricants for roller bearings, see Detailed Purpose for more information. The data is collected from the thesis work ''Livscykelanalys'' by Anders Marby, KTH Ingenjörsskolan. The alcohol used to saponise the oil are not included. They are usually trimethylolpropane and neopentylglycol.

System Boundaries

Nature Boundary	The inflows that are refine resources are the fertilizers N, P and K, but also lime, sulphuric acid and oxygen used for electricity production. There are emissions to both technosphere, air and water included in the system.
Time Boundary	The data is collected from the thesis work ''Livscykelanalys'' by Anders Marby, KTH Ingenjörsskolan, from 1999.
Geographical Boundary	Sweden
Other Boundaries	The oil is not combusted in a waste incineration furnace. Care has to be taken to that many emissions could have been avoided if total combustion had occurred.
Allocations	Not applicable
Systems Expansions	Not applicable

About Inventory	
Publication	Marby Anders; Livscykelanalys; KTH Ingenjörsskolan; 1999 Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Thechnology, December 2002. ------------------ Data documented by Sandra Häggström, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-03-21.
Intended User	Product developer at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The thesis includes case studies of environmental impacts if one or more measures are introduced in the use phase. One case study treats use of rapeseed oil.
Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Sandra Häggström - .
Reviewer	Olle Ramnäs -
Applicability	With care for unspecified rapeseed lubricants.
About Data	Data is collected from the thesis work: Marby, Anders; Livscykelanalys; KTH Ingenjörsskolan; 1999
Notes	

Administrative	
Finished	Y
Date Completed	2013-11-30
Copyright	f3 - Swedish Knowledge Centre for Renewable Transportation Fuels
Availability	Public

Technical System	
Name	Rapeseed methyl ester (RME), cradle-to-gate, energy allocation - f3 fuels
Functional Unit	1 MJ
Functional Unit Explanation	1 MJ output of RME from rapeseed
Process Type	Cradle to gate
Site	
Sector	Fuel
Owner	
Technical system description	This dataset represents a model of the cradle to gate production of RME valid for southern Sweden. The following process are covered: - Cultivation of the rapeseed - Harvest - Distribution to the fuel plant - Production of RME The production of RME is assumed to take place in plants in Karlshamn and Stenungsund. The mineral fertilizer used is assumed partly to be produced in Western Europe (about 60 %) with present level of cleaning equipment etc., and partly imported from countries outside Europe (about 40 %). This implies that about 30 % of the mineral fertilizer production takes place in plants with nitrous oxide cleaning where the nitrous oxide emission levels are reduced with about 80 %. All electricity input in the RME-plant is Swedish grid mix. Fuel used at the RME plant for is of forest origin. Allocation is made based on energy content (only case showed in Miljöfaktaboken, since this allocation method is preferred by the Renewable Energy Directive), however a case with system expansion is made in Börjesson et al. which also has been published in the f3 database. Transport distances are estimated based on southern Sweden conditions. The study is based on BAT (Best available technology). Capital goods are not included. Impacts from production of buildings and infrastructure are not included.

System Boundaries	
Nature Boundary	
Time Boundary	2010 - 2013
Geographical Boundary	Cultivation of rapeseed (assumed on good soil) and handeling and storing of waste and manure is in Southern Sweden.
Other Boundaries	
Allocations	The outputs from the RME production are RME and the byproducts rapeseed meal and glycerol. Emissions and primary energy demand are all allocated between the RME and the byproducts. Energy allocation is based on the following energy contents: RME 37,2 MJ/kg, rapeseed meal 15,3 MJ/kg, glycerol 16,2 MJ/kg.
Systems Expansions	No.

Flow Data	
General Activity QMetaData	
Date Conceived	
Data Type	
Represents	Rapeseed oil for use as hydraulic oil in forest machines.
Method	Literature studies

Literature Reference	Gode, J. et al., 2011, Miljöfaktaboken 2011, Uppskattade emissionsfaktorer för bränslen, el, värme och transporter, Värmeforsk Data in Gode et al. Are based on: Börjesson, P. et al., 2010, Life cycle assessment of biofuels in Sweden, Report nr 70 LTH. But since data in Börjesson et al. is only given in impact categories not per emissions Gode et al. is used.
Notes	National values for environmental loadings for electricity production can be linked to the electricity use.

SPINE LCI dataset: Reconditioning of bearing

Administrative	
Finished	Y
Date Completed	2002-12-18
Copyright	
Availability	Public

Technical System	
Name	Reconditioning of bearing
Functional Unit	1.2 kg of bearing
Functional Unit Explanation	One SKF spherical roller bearing size 232/530 weighs 1.2 ton.
Process Type	Gate to gate
Site	SKF Service SKF Sverige AB, 415 50 Göteborg
Sector	
Owner	SKF Service SKF Sverige AB, 415 50 Göteborg

Technical system description	A bearing is used a certain period before it is dismounted and examined at the plant. If it looks ok it is sent for reconditioning, otherwise it is scrapped directly from the location where it is used. The bearing is examined visually to see if it has damages that are so severe that the bearing cannot be reused. If so it is scrapped. If no severe damages can be seen by the eye, the bearing is examined with ultrasound. If no cracks are discovered in this step either it is sent for polishing.

System Boundaries

Nature Boundary	The bearings, the lubricant, and the cleaning agent come from and leave to the technosphere. Emissions to air, water and ground were not included due to lack of data.
Time Boundary	Data is collected autumn 2002. No changes are planned for the nearest future.
Geographical Boundary	The reconditioning takes place at SKF in Göteborg.
Other Boundaries	
Allocations	Not applicable
Systems Expansions	Not applicable

Flow Data

General Activity QMetaData

Date Conceived	2002-11-29 - 2002-12-31
Data Type	Unspecified
Represents	N/A
Method	Interview with Jan Blomquist at SKF Service AB
Literature Reference	none
Notes	The bearings from Holmen Paper AB are reconditioned once during the bearings lifetime.

Flow Table and Specific Meta Data

QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Refine resource	Bearing	1.2			tonne	Technosphere	
Notes: 1 dl Castrol is used, density 0.76 kg/l.	Input	Refine resource	Castrol 86/27	0.076			kg	Technosphere	Sweden
Notes: The polishing takes 15-60 minutes depending on the damages. The average time needed for one rings is 40 minutes. Both the outer and inner ring are polished. The effect needed is 8 kW, 16 kW for both, so this number is multiplied with the time 40 minutes.	Input	Refine resource	Electricity	10.72			kWh	Technosphere	
	Output	Residue	Bearing	1.2			tonne	Technosphere	
	Output	Residue	Castrol 86/27	0.076			kg	Technosphere	Sweden
	Output	Residue	Mobil Glygoyle 30	0.4024			kg	Technosphere	Sweden

About Inventory

Publication	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Thechnology, December 2002. ------------------- Data documented by Sandra Häggström, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-03-21.
Intended User	Product developer at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The purpose for our study is to compare a coated roller bearing to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.

Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Sandra Häggström - .
Reviewer	Olle Ramnäs -
Applicability	All bearings reconditioned at SKF Service AB in Göteborg, or with similar conditions.
About Data	The data is gathered interviewing Jan Blomquist at SKF Service AB.
Notes	

SPINE LCI dataset: Recycling and temporary storage of metals

Administrative	
Finished	Y
Date Completed	1995-03-01
Copyright	
Availability	Public

Technical System	
Name	Recycling and temporary storage of metals
Functional Unit	ton
Functional Unit Explanation	1 ton reprocessed iron and scrap-metal
Process Type	Gate to gate
Site	Stena Metall Återvinning AB Salsmästaregatan 20 422 46 Hisings Backa
Sector	Waste treatment
Owner	Stena Metall Återvinning AB Salsmästaregatan 20 422 46 Hisings Backa
Technical system description	The company recycles and stores scrap-metal. The recycling is done through sorting. The reprocessing of the purchased goods is done through sorting by hand and mechanical work. The reprocessed goods are temporarily stored to be delivered to steel and metal melting plants. Material such as transformers is not processed, but is transported to Stena Metal in Karlstad to be scrapped. Car batteries are temporary stored in stainless containers. The company may not store more than three containers at the site. When the quota is filled the containers are transported and delivered to Boliden Bergs;e in Landskrona.

System Boundaries	
Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries	
Allocations	
Systems Expansions

	Input	Refined resource	Metal	0.083879423			tonne	Technosphere	
	Input	Refined resource	Stainless steel	0.01965924			tonne	Technosphere	
Notes: The waste is disposed by GRAAB	Output	Residue	Industrial waste	0.018348624			g	Technosphere	

About Inventory

Publication	The environmental report from Stena Metal Återvinning AB for 1994, The Environmental Administration in the municipality of Göteborg. --- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology ---
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg. .
Practitioner	Håkansson, Lars - Stena Metall Återvinning AB Salsmästaregatan 20 422 46 Hisings Backa.
Reviewer	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg.
Applicability	There are more current environmental reports from the company, but those lack important information. In the environmental reports from 1995 and 1996 only the outgoing flows are specified. If one would like to use the data from the latest reports one would have to assume that the ingoing flows are the same for 1995 and 1996 as 1994, or try to find some kind of connection between the year and the ingoing flows. To use the first assumption would probably be a misstake, because earlier environmental reports show that the ingoing flows differ a lot between different years.
About Data	The company buy up steel and scrap-metal from industries and purchasers. 1994 the company bought 34 000 ton iron, 750 ton stainless-steel and 3200 ton metal.
Notes	

SPINE LCI dataset: Recycling of polyethene

Administrative

Finished	Y
Date Completed	1991
Copyright	
Availability	Public

Technical System

Name	Recycling of polyethene
Functional Unit	1 kg
Functional Unit Explanation	1 kg recycled polyethylene
Process Type	Gate to gate
Site	
Sector	Waste treatment
Owner	
Technical system description	The recycling process of polyethene involves grinding of the collected material, which is followed by washing, drying, extrusion and granulation of the grinded plastic.

System Boundaries

Nature Boundary	
Time Boundary	
Geographical Boundary	
Other Boundaries	Only the energy consumption, the material that is edmitted and the waste that is not recycleble are accounted for.
Allocations	Some emissions into water occur during recycling. The effluent goes to the authority sewage treatment plant. The primary source of the pollution is not plastic but remains of the contents of the packing. The contents are not part of the system and these emissions are therefore not accounted for.
Systems Expansions

Method: The wastage during recycling is 15 % according to personal communication with Lars Karlson, Rosenlew Emballage AB.	Output	Residue	Polyethylene	0.15			kg	Technosphere	

Notes: The Polyethylene that is not recycleble is disposed of in landfill sites.									

About Inventory	
Publication	Tillman, A-M., H Baumann, E. Eriksson, and T. Rydberg, ''Life Cycle Analysis of Selected Packing Materials. Quantification of Environmental Loadings'' Offprint from SOU 1991:77. Chalmers Industriteknik, Göteborg, Sweden 1992. --- Data documented by: Maria Erixon and Sara Ågren, project employed at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Henrikke Baumann and Anne-Marie Tillman (responsible for the course material) and Ann-Christin Pålsson (responisble for classification of the dataset), Technical Environmental Planning, Chalmers University of Technology ---
Intended User	A Life Cycle Assessment practi
General Purpose	The data set is part of a study about packaging and the environment.
Detailed Purpose	Exercise material in LCA coarse given at Teknisk Miljöplanering at Chalmers University of Technology, Sweden.
Commissioner	
Practitioner	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden.
Reviewer	
Applicability	The data are valid for Swedish conditions, but can be used as an approximation to other countries. One should though be aware of the fact that the situation in other countries may be very different and depending on this get one gets an unreliable result. The data are based on old sources and should therefore not be regarded as information describing the current situation. The emissions caused by the production of the electricity used in the system are not accounted for.

SPINE LCI dataset: Red brass sandcasting

Administrative	
Finished	Y
Date Completed	1995
Copyright	Metall/ Berlin Metall Verla 1947-
Availability	Full availability

Technical System	
Name	Red brass sandcasting
Functional Unit	1 kg cast red brass
Functional Unit Explanation	
Process Type	Gate to gate
Site	Germany
Sector	Materials and components
Owner	Germany

Technical system description	Pure metal and block metal is transported, melted, cast and cleaned. The numbers are an average of three different data sets which in turn are averges of German industry. Red brass are alloys with copper, tin, zink and lead in different compositions but with a high copper content, approximately 85%. Approximately 50% of the raw material used for the red brass is recycled material. Also approximately 800 g of sand is needed for the casting of 1 kg of red brass. Some of the sand is recycled.

System Boundaries

Nature Boundary	Not given
Time Boundary	Not given
Geographical Boundary	Germany
Other Boundaries	Not given
Allocations	Not given

Flow Data

General Activity QMetaData

Date Conceived	1995
Data Type	Unspecified, expert outspoke
Represents	German copper industry
Method	Not given
Literature Reference	K.H. Bruch, D. Gohlke, C. Kögler, J. Kruger, M. Reuter, I. v. Röpenack, E. Rombach, G. Rombach, P. Winkler. Sachbilanz einer Ökobilanz der Kupfererzeugung und - verarbeitung, Teil 1. Metall 49(1995)4, 252-257, Teil 2. Metall 49(1995)5, 318-324, Teil 3. Metall 49(1995)6, 434-440.
Notes	The total primary energy required for transporting, melting, casting and cleaning is 15.3 MJ/kg product. For the melting induction and fossil fuel heated furnaces are used. For electricity a German electricity mix is used and described (in wastes and emissions) as well as the energy from fossil sources. Values in terms of MJ/kg for different transports are given with the specific emissions connected to them. The energy use for a number of help materials is included. Only small amounts of water are used.

Finished	Y
Date Completed	2009
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Refinery in crude oil based LDPE production process. ESA-DBP
Functional Unit	1.2 kg of naphtha
Functional Unit Explanation	1.2 kg of naphtha is needed to produced 1 kg of LDPE which was the object of the study.
Process Type	Other
Site	Shell Raffinaderi AB Göteborg
Sector	Fuel
Owner	Shell Raffinaderi AB Göteborg
Technical system description	Refinery discussed in this study is one of the steps of crude oil based LDPE (low density polyethylene) production process. This process is a unit operation but the electricity and fuel used in this process are traced back to the cradle. In this step the crude oil is processed into the naphtha. Excerpt from the report, see 'Publication': ''Before the refining can start, contaminants (water, inorganic salts or suspended solids) must be removed. This is done by desalting. There are two different desalting processes. One is chemical desalting. In this process, the crude oil is mixed with water and surfactants and heated up. This causes dissolving or attaching of the impurities to the water and finally their settle out. The other process is electrical desalting. It includes the exposure of the oil to high-voltage electrostatic charges, which promotes the concentration of impurities on the bottom of the storage tank. After this pretreatment the refining starts with the preheating of the crude oil up to 220-250ºC (in heat exchangers fed with recovered heat from the refining process). A further heating up to the column temperature (360-380ºC) follows in a furnace (crude heater) before the oil enters the column. In the column (atmospheric column) the partially vaporized oil is separated into, side and bottom products. Part of the top product is used as reflux for the column. The reminder goes to the naphtha hydrotreater. The other products go to the strip-ping columns, in the case of the side products resp. to the vacuum column for the bottom product. The hydrotreatment is the removal of sulfur components in the top product. The later is mixed with hydrogen-rich gas, then heated up and lead through a catalyst bed. In the catalyst bed, the sulfur reacts with the hydrogen to hydrogen sulfide which is then separated in the subsequent separation steps. The first step is a high pressure separation used to recover the not reacted hydrogen. The second step is a low pressure separation in which the hydrogen sulfur is removed. Finally, the hydrotreated top product is stabilized and the naphtha is separated from the rest of the

	top product in a gasoline splitter.'' This process is included in the system described in: Liptow Ch., Tillman A.-M. (2009). Comparative life cycle assessment of polyethylene based on sugarcane and crude oil. Environmental Systems Analysis, Report 2009:14, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2009--14.pdf Other processes in the CPM Database also included in the above publication:

System Boundaries

Nature Boundary	Excerpt from the report, see 'Publication': ''Outputs accounted for in this study were by-products and emissions released to air. Water emissions were omitted, because of data unavailability for some parts of the sugarcane route.'' The data relate also to the fuel and electricity consumption which were traced back to the cradle.
Time Boundary	Data for refinery come from 2007 and they were acquired as the most up-to-date ones.
Geographical Boundary	Data are valid for Sweden but for electricity calculations average European data were used.
Other Boundaries	Excerpt from the report, see 'Publication': ''products stated under 'bensinprodukter' are treated as naphtha - all data are calculated on this value
Allocations	Excerpt from the report, see 'Publication': ''allocation between naphtha and other products based on weight ; naphtha share = 0,26''
Systems Expansions	Not applicable

Intended User	LCA practitioner

General Purpose	Excerpt from the report, see 'Publication': ''The goal of this study is to answer the question, is the use of sugarcane based LDPE in the production of goods and packing in Sweden environmentally preferable to crude oil based LDPE.''
Detailed Purpose	Refinery is a step in the production process of LDPE so it was necessary to investigate the environmental load of it.
Commissioner	Unknown - .
Practitioner	Christin Liptow & Anne-Marie Tillman - Environmental Systems Analysis, Chalmers University of Technology.
Reviewer	Tillman, Anne-Marie - Environmental Systems Analysis, Chalmers University of Technology
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Years 2009-2011. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: The Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	Refinery is a step in a production process of oil based LDPE which was the object of the study. The production process starts with crude oil extraction and is followed by refinery, steam cracking, polymerization, use phase (which was excluded from the study) and inceneration as the end of life. Oil based- was compared in the study to the sugarcane based- LDPE. NB: in the report two approaches were investigated: attributional and consequential. For consequential approach see the report.

SPINE LCI dataset: Refining of crude oil

Administrative	
Finished	Y
Date Completed	1991
Copyright	
Availability	Public

Technical System	
Name	Refining of crude oil
Functional Unit	1 kg
Functional Unit Explanation	1 kg refined oil product.
Process Type	Gate to gate
Site	Scanraff Lysekil
Sector	Materials and components
Owner	Scanraff Lysekil
Technical system description	The refining of oil starts with destillation, where light fractions are separated from the heavier ones. Examples of lighter fractions gas, naphtha, gasoline and paraffin. Heavier fractions are diesel, followed by heavy fuel oils and residues. Cracking then enables the portions of light fractions to be increased. Some of the crude oil, which arrives at the refinery is used initially as process fuel i.e. for distillation and cracking, while some of it is lost via process emissions to air and water. The crude oil is desulphurised in order to obtain products with lower sulphur content.

System Boundaries	
Nature Boundary	The emissions to air and water are the only parameters that are accounted for. The emissions are caused by: flaring, handling of waste process water, surface water and ballast water, diffuse emissions, desulphurisation of the crude oil and burning of internal fuel.
Time Boundary	
Geographical Boundary	
Other Boundaries	Energy consumption and the raw material used are accounted for.
Allocations

SPINE LCI dataset: Refining of crude oil in to diesel

Administrative	
Finished	Y
Date Completed	1996
Copyright	
Availability	Public

Technical System	
Name	Refining of crude oil in to diesel
Functional Unit	1 MJ
Functional Unit Explanation	The amount of diesel environmental class 1 containing the energy amount 1 MJ.
Process Type	Gate to gate
Site	Scanraff (Skandinaviska Raffinaderi AB)
Sector	Fuel
Owner	Scanraff (Skandinaviska Raffinaderi AB)
Technical system description	The system involves the refinery Scanraff, which produces diesel environmental class 1 from crude oil. Scanraff is a refinery situated at Broviken. It is the largest and most advanced in Sweden. Scanraff is also considered to be the most environmental friendly refinery in Sweden at this moment in time (1997). In the refinery petrol, diesel, LPG and MTBE are produced from crude oil. The refining A refinery consists of the following parts: -Harbour where the crude oil is unloaded -Storage of the crude oil in tanks and rock shelters -Crude oil distillation including desalination -Vacuumdestillation of heavy (viscous) oil -Visbreaker -Catalytic cracking of heavy oil -Light hydrocracking -Synsat plant -Naphtha desulphurization -Catalytic reforming of petrol components -Polymerization plant -Isometrization plant -LPG-extraction -Merox for paraffin, heavy naphtha and LPG -Amine treatment -Sulphur recycling including -Tail gas plant -Equipment for steam production -Cooling system -Torching system

	-Tanks, spheres and rock shelters used for storage of products -Harbour where the products are shipped away Because of the location of Scanraff the waste heat can not be used for central heating.

System Boundaries

Nature Boundary	Emissions and energy consumption is accounted for in the table.
Time Boundary	The data describes the current situation, and will be inaccurate in another context.
Geographical Boundary	Sweden
Other Boundaries	No concern has been taken about waste heat, because the geographical situation decides how the waste water can be used, for example as district heating. In the case of Scanraff this is not possible. The production and transporting of the raw material (crude oil) are not part of the system.
Allocations	Because the integrated nature of a refinery it is difficult to allocate emissions and energy consumption to the different steps in the process of getting the final products. The energy consumption and emissions are therefore allocated to the final product, which in this case is diesel environmental class 1.

Applicability	To get more information about the crude oil, which is used in the process of making petrol one can use data from the activities Extraction of crude oil and Transportation of crude oil to Sweden. The first activity describes the environmental load, in form of emissions and energy consumption, for extraction of off shore crude oil in Norway. If this data is used one must be aware of the fact that Scanraff does not entirely use crude oil from Norway. Only approx. half of the crude oil used at that refinery comes from Norway. The remaining part comes from countries with less environmental restrictions and with not so advanced technology. This implies that the environmental load given from these data is most probably lower than the real load at Scanraff. The crude oil is imported mostly from Norway (49% of the total amount crude oil imported to Sweden comes from Norway). All oil coming from Norway is off shore produced crude oil. The rest of the crude oil comes from the following countries in the following amounts: Iran 11%, Lettland 8%, Venezuela 8%, South Arabia 6%, Denmark 6%, Egypt 6%, Nigeria 3% and other countries 3%. The Norwegian data regarding the figures for extraction of crude oil is considered to be reliable, because of the harsh legislation from the Norwegian government. The second activity mentioned above describes the environmental load due to transporting crude oil to Sweden. In this activity account is taken to the fact that Sweden imports oil from different parts of the world in different amounts. If the environmental load for the electricity used in the system the following information should be used: When producing electricity emissions are let out. The electricity consumption in the table are given emission factors due to the mix of different kinds of electricity produced in and imported to Sweden during 1995. The following figures are used: CO_2 6891 mg/MJ CO 4,2 mg/MJ NO_x 11,7 mg/MJ NMHC 6,50 mg/MJ SO_x 9,7 mg/MJ Subs. solids 1,5 mg/MJ The figures come from Vattenfall Energisystem AB, 1997, through personal conversation with Ulrika Dethlefsen (08-7395588)
About Data	The data in the tables are found in the environmental report from Scanraff for 1995 or comes from personal contacts with fuel experts from Scanraff. The production at Scanraff 1995 The amount of processed raw material (97,6% crude oil): 9,7 million tons Crude oil: 97,6% Propane and Butane: 0,103% Condensate: 0,134% Naphtha: 0,904% MTBE: 0,257% Gas oil: 0,103% RUFO: 0,308% Ballast oil and additives: 0,0205% Rests: 0,586% The amount raw material put into catalytic cracking: 1,49 million tons The amount raw material put into the visbreaker: 1,38 million tons The amount raw material put into MHC plant 2,58 million tons The amount raw material put into the synsat plant 1,75 million tons The amount raw material put into the naphtha desulphurization: 1,98 million tons The amount raw material put into the isomerization: 0,41 million tons The total emissions from Scanraff 1995 CO_2: 0,95 Mton CO: 82 ton NO_x: (counted as NO_2) 980 ton SO_2: 619,4 ton (corresponds to 310 ton sulphur) NMHC: 3400 ton CH_4: negligible Dust: 108 ton

Applicability	To get more information about the crude oil, which is used in the process of making petrol one can use data from the activities ''Extraction of crude oil'' and ''Transportation of crude oil to Sweden''. The first activity describes the environmental load, in form of emissions and energy consumption, for extraction of off shore crude oil in Norway. If this data is used one must be aware of the fact that Scanraff does not entirely use crude oil from Norway. Only approx. half of the crude oil used at that refinery comes from Norway. The remaining part comes from countries with less environmental restrictions and with not so advanced technology. This implies that the environmental load given from these data is most probably lower than the real load at Scanraff. The Norwegian data concerning the crude oil production is considered to be reliable, because of the strict legislation from the Norwegian government. The second activity mentioned above describes the environmental load due to transporting crude oil to Sweden. In this activity account is taken to the fact that Sweden imports oil from different parts of the world in different amounts. The crude oil is imported mostly from Norway (49% of the total amount crude oil imported to Sweden comes from Norway). All oil coming from Norway is off shore produced crude oil. The rest of the crude oil comes from the following countries in the following amounts: Iran 11%, Lettland 8%, Venezuela 8%, South Arabia 6%, Denmark 6%, Egypt 6%, Nigeria 3% and other countries 3%. If the load of the used electricity is to be calculated the following information should be used: When producing electricity emissions are let out. The electricity consumption in the table are given emission factors due to the mix of different kinds of electricity produced in and imported to Sweden during 1995. The following figures are used: CO2 6891 mg/MJ CO 4,2 mg/MJ NOx 11,7 mg/MJ NMHC 6,50 mg/MJ SOx 9,7 mg/MJ Subs. solids 1,5 mg/MJ The figures come from Vattenfall Energisystem AB, 1997, through personal conversation with Ulrika Dethlefsen (08-7395588)
About Data	The data in the tables are found in literature or comes from personal contacts with fuel experts at Scanraff, and their environmental report from 1995. The production at Scanraff 1995 The amount of processed raw material (97,6% crude oil): 9,7 million tons Crude oil: 97,6% Propane and Butane: 0,103% Condensate: 0,134% Naphtha: 0,904% MTBE: 0,257% Gas oil: 0,103% RUFO: 0,308% Ballast oil and additives: 0,0205% Rests: 0,586% The amount raw material put into catalytic cracking: 1,49 million tons The amount raw material put into the visbreaker: 1,38 million tons The amount raw material put into MHC plant 2,58 million tons The amount raw material put into the synsat plant 1,75 million tons The amount raw material put into the naphtha desulphurization: 1,98 million tons The amount raw material put into the isomerization: 0,41 million tons The total emissions from Scanraff 1995 CO2: 0,95 Mton CO: 82 ton NOx: (counted as NO2) 980 ton SO2: 619,4 ton (corresponds to 310 ton sulphur) NMHC: 3400 ton CH4: negligible Dust: 108 ton

Technical System

Name	Relay assembly

Functional Unit	One gram relay for mounting on printed circuit boards
Functional Unit Explanation	The motivation for choosing this functional unit is: · Suitable unit to work with in an LCA of a private branch exchanges (a complicated telecom product) · Important component of the MD110 product system and many other electronic products. DESIGN Both answers from component manufacturer one (CM1) and component manufacturer two (CM2) are for exactly the same component. These facts are based on Ericsson technical specification of the component. Ericsson product number: RAV 954 Ericsson description: RELAY RAV 954 General technical specification Monostable relay for mounting on printed circuit boards. The soldering tags are tin coated. The relay: -is position independent. -is designed for tight packaging placed in modul pitch -is dust and liquid proof -is fixed and connected to the printed board by sodlering. -has twin contacts. -has 2 break before make functions Dimensions: Module (M) = 2.54 mm Weight: app. 1.5 grams according to Ericsson. Height: 6 mm Width: 9.3 mm Length: 14.3 mm
Process Type	Gate to gate
Site	Not relevant
Sector	Manufacturing
Owner	Not relevant
Technical system description	This activity includes the final assembly of relay for mounting on printed circuit boards. The activity is an average based on information acquired from two manufacturers. The description of the process is supplied by manufacturer one, but is assumed to be general for this type of manufacture. The following process steps are included; 1. Press working of iron 2. Degreasing 3. Heat Treatment 4. Plating 5. Welding 6. Injection Molding 7. Cutting and Bending 8. Covering 9. Sealing 10. Winding 11. Soldering Details given: 1. Press working of iron: Punch to form piece parts. 2. Degreasing: . Pure iron parts are degreased with pure water which is provided from waste water recycling equipment. Phospor bronz parts are degreased with alkaline solution. 3. Heat Treatment: Heat to get magnetic characteristics with N2 and H2. This process is done at a heat treatment subcontractor. 4. Plating: Chemical nickel plating is done to make magnetic residual characteristics and an oxidation prevention layer. This process is done at a subcontractor. 5. Welding: Weld to connect two parts. 6. Injection Molding: In our process, metal parts are set up in plastic to be one unit. 7. Cutting and Bending: Work to get needed shape. 8. Covering: A plastic cover is mounted on the relay to cover the movement.

	9. Sealing: Seal to keep constant atmosphere inside the relay. 10. Winding: Wire winding to make electromagnet. 11. Soldering: Dipping in solder bath to make solder covered terminal.

System Boundaries

Nature Boundary	The emissions to air and water have nature as recipient. Each parameter mentioned by the component manufacturers has been studied. No parameter has deliberately been disregarded when environmental impact has been studied. Included component manufacturers have not specified the same parameters. In the cases where only one manufacturer has stated a parameter this has been used.
Time Boundary	1998 The answer from the manufacturer arrived in 1998 and they measured in 1998. The process technology used is most certainly the best available as the factories are located in Japan and the companies are well established.
Geographical Boundary	The technical system for this model is limited to the factory where the production takes place. The manufacturers included in the average are located in Japan.
Other Boundaries	Delimitation’s to the system is the final step in the making of the relay. The production of the subparts (e.g. liquid crystalline polymer, copper alloy, permanant magnet and gold alloy) of the resistor is not included in this model. The transportation of them to the factory is not included. For interested parties who wish to include the transport figures given from the manufacturers, can find the figures in the section Applicability.
Allocations	The manufacturers have not described how the allocation has been made. We did not decide or have any suggestions on how the manufacturer should allocate in their factory.
Systems Expansions	None.

Flow Data

General Activity QMetaData

Date Conceived	1998
Data Type	Derived, unspecified
Represents	The environmental load for the production of reinforcement bars has been approximated with the one for reinforcement steel.
Method	The data that are presented are calculated as an average based on information from two component manufacturers. The information from the manufacturers was acquired using a LCI data questionnaire. The average for each presented flow is calculated as follows: - First the amount of each flow per functional unit is calculated for each component manufacturer - Then the calculated amount for each component manufacturer is summed for each unique flow and divided by the number of included component manufacturers In the information supplied by the manufacturer, they had indicated whether the data for each flow were measured, estimated or calculated. Below is a detailed account of the calculation procedure. Definition of variables: CMn: Component manufacturer number n. Myn: Materials, emission, waste, energy (y) given in component answer n. ACyn: Amount of material y in component, expressed in mg (or similar) by component manufacturer n Wn: Weight of one piece of component, expressed in mg (or similar) by component manufacturer n. Nyn: The flow y expressed per functional unit from manufacturer n. Step 1. For CM1 sum AC1+.+.ACn Step 2: The sum AC11+.+.ACyn = W1 Step 3: Divide all flows between M11...M1n by W1 --> N11...N1n Step 4: Repeat Step 1 to 3 for all component manufacturers and for each flow. Step 5: Sum N1n+..Nyn and divide by the number of terms for each unique flow.(material input, emission etc.) An average calculation like above of up to two answers was made.

Output	Emission	NOx	0.0037			g	Air		
Date concieved: 1998 Data type: Derived, unspecified Method: CM1 states they emit 2400 m3/h. That is 2400*365*24 = 21e6 m3/year and they produce 660 000 relays per year. 21e6/(600000*4,36) = 8,03 m3/g relay CO, CO2, NOx and SOX are 0,3 % chargeable to the above amount. 0,3/100 * 8,03 = 0,024 m3/g This volume is divided on CO2 11,5 %, NOx 150 ppm and SOx 0,0117 % (0,28 m3/h of 2400 m3/h). SOx: 0,0117/100 * 0,024 m3/g = 2,808e-6 m3/g Density SO2: 2,93 kg/m3 (ISBN 91-27-72174-4, page 72, SOx approximated as SO2) SO2: 2,808e-6*2,93 kg/m3 = 8,227e-3 g/g This is not an average value and the figure is based only on one answer.	Output	Emission	SOx	0.0082			g	Air		
Date concieved: 1998 Data type: Derived, unspecified Method: 1 gram relay output is the base for all figures in this model. Relays = Life Cycle Inventory model for production of one gram of relay (applicable to telecommunication equipment) (This model is based on two answers for surface mounted relays applicable to telecommunication equipment).	Output	Product	Relays	1			g	Technosphere		
Date concieved: 1998 Data type: Derived, unspecified Method: CM1: 1/4360 = 0,000229 g/g This is not an average value and the figure is based only on one answer.	Output	Residue	Epoxy	0.00023			g	Technosphere		
Date concieved: 1998 Data type: Derived, unspecified Method: CM1: 1743/4360 = 0.4 g/g (stated as Pure iron by CM1) This is not an average value and the figure is based only on one answer.	Output	Residue	Fe	0.4			g	Technosphere		
Date concieved: 1998 Data type: Derived, unspecified Method: CM1: 540/4360 = 0,124 g/g This is not an average value and the	Output	Residue	Liquid crystal polymer (LCP)	0.124			g	Technosphere		

figure is based only on one answer.									
Date concieved: 1998 Data type: Derived, unspecified Method: CM1: 4603/4360 = 1,055 g/g This is not an average value and the figure is based only on one answer.	Output	Residue	Phosphorous bronze	1.06			g	Technosphere	
Date concieved: 1998 Data type: Derived, unspecified Method: CM1: 340/4360 = 0,078 g/g This is not an average value and the figure is based only on one answer.	Output	Residue	Polyphenyl sulphide	0.078			g	Technosphere	
Date concieved: 1998 Data type: Derived, unspecified Method: CM1: 76/4360 = 0,0174 g/g This is not an average value and the figure is based only on one answer.	Output	Residue	Solder	0.017			g	Technosphere	

About Inventory

Publication	Not available -- Data documented by: Anders Andrae, Ericsson Business Networks AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The intended use for this LCI
General Purpose	The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks. The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system. The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB. Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts. The main purpose of the study for Ericsson is; - to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and - to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the internal work with an Environmental Management System for Ericsson Enterprise Systems. Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson. The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.
Detailed Purpose	Map a relay manufacturing/assembly process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the final assembly of relays and resembling components in our telecom products. The usage for this set of data are life cycle assessments where relays are part of the studied system. Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX. The division into component groups is based on structural resemblance, electrical function and material contents of the different components. -- Below is a list of the component groups and corresponding models that have been compiled: 1. Cables - Model: Cable assembly 2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly

	3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly 4. Connectors and holders - Model: Connector assembly 5. Diodes - Model: Diode wafer production and assembly 6. Display units and indicators - Model: Liquid crystal display assembly 7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked) 8. Other - Model: ''Other'' electronic component assembly 9. Potentiometers - Model: Potentiometer assembly 10. Printed boards - Model: Printed board assembly 11. Relays - Model: Relay assembly 12. Resistor networks - Model: Resistor network assembly 13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly 14. Resistors; surface mounted devices - Model: Resistor for surface mounting assembly 15. Transformers and inductors - Model: Inductor assembly 16. Transistors and opto couplers (2 models) - Models: 1. Transistor assembly and 2. Si wafer production and Si wafer processing for transistors (these models are interlinked)
Commissioner	- Ericsson .
Practitioner	Andrae, Anders - Ericsson Business Networks AB Augustendalsvägen 21 S-131 89 Stockholm Office: Nacka Strand .
Reviewer	Pålsson, Ann-Christin - CPM Chalmers University of Technology S-412 96 Göteborg Sweden
Applicability	This set of data can be applied to relays intended for mounting on printed circuit boards in electronic equipment if you know how much the relays weigh. -- Transports. -- Here follows a more detailed description of transports of materials and components to the respective manufacturer factories. These transports are not included in the model. The calculation for all modes of transport is done like this: First the total transportation work per functional unit is calculated for each included component manufacturer. Then the total transportation is summed and divided by the number of included component manufacturers. This gives the average value for transportation by each mode of transport. -- Truck transportation: -- CM1 = Component manufacturer one Weight of component: 4.36 g CM1: Liquid crystalline polymer with weight 1080 mg is transported 360 km + Polyethylene sulfide 400 * 360 + Pure iron 2905 * 360 + Phosphorous bronze 6433 * 400 + (sus316) 0,4 * 400 + AuAg alloy 4,2 *200 + cobalt magnet 30 *55 + epoxy resin 12 * 400 + Solder 85 * 450 + Flux 12* 450 + 2-propanol 12 * 360 + Punching oil 8 * 360 + Grease 2 * 360 + Potassium cyanide 1 * 360 + Ethanol 8 * 360 The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives: 4213.94 gkm/4,36 g = 966,5 gkm/g Component manufacturer two (CM2): Weight of component: 2.96 g Epoxy resin with weight 75 mg is transported 200 km, i.e. 75 mg*200 km + Permanent magnet 210 * 900 + Liquid crystalline polymer 4200 * 300 + Copper alloy 1580 * 300 + PUR enameled copper wire 0,21 * 400 + Mild steel 1,4 * 200 2299.92 gkm/2,96 g = 777 gkm/g This gives the average total transportation work by truck for CM1 and CM2: (CM1+CM2)/2 = 872 gkm/g relay

	This is an average value and the figure is based on two answers.
About Data	The data is based on information from two Japanese manufacturers. The information was gathered using a life cycle inventory questionnaire. All flows are not average values and where there were only one manufacturer stating a certain flow, this one was chosen in the model. Of the flows about little more than 85 % are not average values. The flows for Energy input of Electricity, Raw material input of Co, Epoxy resin, Fe, Liquid crystal polymer (LCP) and Phosphorous bronze are average values. In specific QMetaData for each flow, we have indicated specifically for each flow how many manufacturers have been included. The figures in the original answer from the manufacturers should all have a special tag telling if the value has been calculated, measured or estimated or a combination of two or three of them. Ericsson specifically told the manufacturers to do so. The result for CM2 is that approximately 90 % of the flows used in all manufacturers answers were only estimated, 3 % were only calculated, and 7 % of the flows were only measured.. The outline of the LCI data questionnaire that was used in the inventory follows below. No limitations or specifications were set for which substances they had to account -- LCI data questionnaire -- Transport description: Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km). We here only asked for flows exceeded 2% by weight of the material declaration of the component. Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes. Process description. Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gathered it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (E.g. planned changes in production rate) Material, components and natural resource input, etc. We told them to express data in amount per functional unit. Name of material, component or resource. Used amount (mg). Amount In Product (mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production sites (address). Suppliers of transport (address). Additional information. Emissions. Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information. Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information. Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information. Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.
Notes	

SPINE LCI dataset: Remelting of aluminium scrap

Administrative	
Finished	Y
Date Completed	2002-05-07
Copyright	EAA
Availability	Public

Technical System	
Name	Remelting of aluminium scrap
Functional Unit	1000 kg aluminium ingot
Functional Unit Explanation	Aluminium rolling or extrusion ingot.
Process Type	Gate to gate
Site	Not specified. See Geographical boundaries for further information.
Sector	Materials and components
Owner	Not specified. See Geographical boundaries for further information.
Technical system description	The inventory data cover remelting of aluminium process scrap, i.e. scrap generated internally, during the production of aluminium semi-finished products. The scrap input for aluminium remelting is clean scrap, i.e. excluding coated scrap, other contaminated scrap (through oil, dirt, etc.) and skimmings, which are processed via the aluminium refiners.

System Boundaries	
Nature Boundary	--- BOUNDARIES VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- Cut-off criteria through out this inventory is basically relevance, as checked by the industry expert team monitoring the work and confirmed by reviewer I. Boustead. As a rough guideline ''less than 1% of total mass'' is applied for the inputs, i.e if the input is less than 1% of the total mass, then it is not included in the inventory table. The base for the choices of included inventory parameters is not further described in the EAA report.
Time Boundary	--- BOUNDARIES VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- The data derived from an industry survey from 1998 and includes literature data from reports dated 1998 and 1999.
Geographical Boundary	--- BOUNDARIES VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- It is not always explicit in the report where the different included process steps take place. Data may be acquired from outside of Europe, e.g. regarding ancillary materials. See litterature references (LitteratureRef) next to the flow table (FlowMetaData) for further information about the data sources for each process step.
Other Boundaries	See Nature boundaries for a specification of the cut-off criteria that has been applied.
Allocations	Allocations are not explicitly specified in the Environmental Profile Report 2000.
Systems Expansions	System expansions are not explicitly specified in the Environmental Profile Report 2000.

Flow Data	
General Activity QMetaData	
Date Conceived	1998 - 1999
Data Type	Derived, unspecified
Represents	Not relevant.
Method	REMELTING OF ALUMINIUM SCRAP Data were obtained from aluminium-integrated cast house operations, i.e. cast houses associated with semi-finished aluminium production. The 1998 survey on semi-finished aluminium products also encompassed aluminium-integrated cast houses, with 37% coverage for the recycling of process scrap. TRANSPORTS Transport energy and air emission data have been taken from SAEFL Environmental Series 250

	(1998) ''BUWAL 250'', table 16.9 ELECTRICITY For all manufacturing operations, the consumption of fossil fuels and emissions linked to electricity production was calculated according to the UCTPE 94 electrical energy model as described in BUWAL 250. Emissions from combustion only, i.e. without the precombustion contribution, have been considered where appropriate in order to make a direct comparision with the corresponding process emissions. Emission data for combustion came from a report prepared by EMPA for EEA (13 December 1997), showing the respective contributions of precombustion and combustion in 'BUWAL 250, table 16.9'. Although emissions from fuel combustion were often covered in the industry survey reporting, data calculated from BUWAL 250 were always used, inview of the fact that the survey results were not sufficiently reliable due to inconsistent use of conversion factors.
Literature Reference	---Recycling - Aluminium scrap terms and definitions: pr EN 12258-3 - Aluminium BREF note: document prepared for the EU Comission, 1999 ---Transport energy, electricity, and air emission - SAEFL Environmental Series 250 (1998) ''BUWAL 250'', table 16.9 - EMPA report for EAA dated 27 April 1998, derived from Buwal 250 for national grid systems.
Notes	In this inventory profile it is possible to identify if the emission derives from the process or the energy use, see Note-field for each specific flow.

Notes: This residue derives from the rolled sheet production.	Output	Residue	Non hazardous waste	1.5			kg	Technosphere	

About Inventory

Publication	Environmental Profile Report for the European Aluminium Industry, European Aluminium Association, April 2000 -- Data documented by: Maria Erixon, IMI, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, IMI, Chalmers University of Technology Published in SPINE@CPM: 8 May 2002 --
Intended User	LCA-practitioners.
General Purpose	The European Aluminium Association (EAA) aims to contribute to further environmental improvements in aluminium products in a life cycle concept.
Detailed Purpose	The purpose with the Environmental Profile Report 2000 is to provide LCA-practitioners with detailed and up-to-date information representing the aluminium industry activities in Europe. The purposes with formatting the Environmental Profile Report 2000 for the European Aluminium Industry to the data documentation format SPINE, according to the data documentation criteria applied at Centre for environmental assessment of Product and Material systems (CPM) are: - CPM and European Aluminium Association (EAA) are anxious to provide life cycle assessment (LCA) practitioners with accurate and up to date environmental data for aluminium production. - EAA is interested in the SPINE formatting procedure and result, as the format is a base for (and therefor somewhat similar to) the new Technical Specification in ISO, ISO 14048, regarding LCA data documentation format. - EAA is interested in the CPM data quality control and documentation criteria.
Commissioner	- EAA (European Aluminium Association) 12 Av. de Broqueville B-1150 Brussels .
Practitioner	- EAA (European Aluminium Association) 12 Av. de Broqueville B-1150 Brussels .
Reviewer	Dr. Ian Boustead, - 2 Black Cottages West Grinstead, Horsham GB-West Sussex RH13 7BD
Applicability	--- GENERAL INFORMATION VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- RECOMMENDATIONS BY EAA WHEN USING THE DATA The data provided by the EAA members for their own process steps are the most up-to-date average data available for these processes, and it is recommended that they be used for LCA purposes. Older literature data should be disregarded, as it may no longer be representative due to technological improvements, progress in operating performance, changes with regard to raw materials or waste treatment, etc. To complete the product system inventory, data - on the production of consumer products, from semi-fabricated aluminium, - on the performance of consumer products in the use phase, and - on the recovery of scrap prior to remelting at the end of the product's useful life should be acquired. EAA recommend that these data be used in LCA studies in accordance with methodologies within the framework of the international standards in the ISO 14040-series. RELATED DATA SETS IN SPINE DATA FORMAT The data presented in the Environmental Profile Report is reformatted in to the SPINE format and structured according to the SPINE concept in as many separate activities (sub-systems) as possible. The system scope for the study as a whole is primary aluminium production, semi-finished aluminium production, and recycling. The SPINE formatting resulted in 7 activities. These activities are all published in the SPINE@CPM database. The production and recycling step are intended to be used together. For example, to obtain a cradle to gate-system for rolled aluminium sheet, the activity Primary aluminium production should be connected to the activity Production of rolled aluminium sheet. A recycling step (Aluminium recycling by refiners) could also be connected to such a system, depending on the scope. -- List of activities formatted in the SPINE-format, published in SPINE@CPM -- Primary aluminium production 1. Primary aluminium production

	Semi-finished aluminium product fabrication 2. Production of rolled aluminium sheet 3. Production of extruded aluminium profiles 4. Production of 0,02-0,2 mm single-rolled aluminium foil 5. Production of 0,005-0,02 mm double-rolled aluminium foil Recycling 6. Re-melting of aluminium scrap 7. Aluminium recycling by refiners Please note: The recycling process 6. Re-melting of aluminium scrap is included in the semi-finished aluminium product fabrication, i.e. activities 2-5. When designing a product system with the activities above where recycled aluminium is regarded, the activity Aluminium recycling by refiners should be used. The Re-melting of aluminium activity is only a specification if the user is specifically interested in this process step. RECYCLING RATES FOR ALUMINIUM PRODUCTS AFTER USE After use, aluminium products are a valuable re-usable resource. The European recycling rates for end products are currently around 95% for the automotive sector and 85% for the building sector. IMPROVEMENTS IN THE ENVIRONMENTAL PERFORMANCE OF ALUMINIUM PRODUCTS AND PROCESSES OVER THE PAST FEW YEARS Over the past few years EAA has achieved major improvements in the environmental performance of its production processes by means of the following: - improvement on existing technology - development and introduction of new technology and operations - increased recycling of all materials in the production process. Examples of major environmental improvements in aluminium products achieved over the past few years include: - weight reduction by downgauging in the packaging sector - energy savings through weight reduction and subsequent fuel reduction in the transport sector - reduction of maintenance in the building sector The previous Ecological Profile Report from EAA was published in 1996.
About Data	--- GENERAL INFORMATION VALID FOR ALL DATA SETS FROM THE ENVIRONMENTAL PROFILE REPORT 2000 --- PRECISION According to EAA, the environmental data figures in the inventory table are usually accurate to a precision of 5%. DATA SOURCES FOR FUELS/ENERGY PRODUCTION AND COMBUSTION The electricity supply systems and fuel production and use (transport energy and emission data) have been taken from SAEFL Environmental Series 250 (1998) 'Buwal 250' and EMPA report for EAA dated 27 April 1998, derived from Buwal 250 for national grid systems. All emissions connected with total fuel consumption (i.e. production and combustion of oil, gas or coal) have been taken from SAEFL Environmental Series 250 (1998) 'Buwal 250', table 16.9. Emissions from combustion only, i.e. excluding the contribution of the production of the fuel, have been considered where appropriate in order to make a direct comparision with the corresponding process emissions. Emission data for combustion came from a report prepared by EMPA for EEA (13 December 1997), showing the respective contributions of production and combustion of fuels in 'BUWAL 250, table 16.9'. Although emissions from fuel combustion were often covered in the industry survey reporting, data calculated from BUWAL 250 were always used, in view of the fact that the survey results were not sufficiently reliable due to inconsistent use of conversion factors. REVIEW OUTSPOKE Ian Boustead has reviewed and commented on the Environmental Profile Report for the European Aluminium Industry, April 2000, which is a revision of the first Ecological Profile Report from EAA that were published in 1996. Ian Bousteds' review comments on the Environmental Profile Report for the European Aluminium Industry, April 2000: ''...I have received the detailed calculations on which this present environmental report is based. All of the queries that I raised after working through these reports were answered satisfactory.'' Ian Bousted, Environmental Profile Report for the European Aluminium Industry, April 2000 ''Good-quality data were supplied by the EAA member companies, and the number of companies participating provides good coverage of the various processes, meaning that the results can be regarded as representative of the industryas a whole for the production of primary aluminium and subsequent conversion processes.'' Ian Bousted, Environmental Profile Report for the European Aluminium Industry, April 2000 ''Because of the very fragmented nature of the recycling industry and wide variations in

	practices, it is recognised that the data presented for this sector of the industry can only be regarded as indicative. Nevertheless it is helpful to have such information from an authorative source.'' Ian Bousted, Environmental Profile Report for the European Aluminium Industry, April 2000
Notes	REVIEWER Ian Boustead has reviewed and commented on the Environmental Profile Report for the European Aluminium Industry, which is a revision of the first Ecological Profile Report from EAA that were published in 1996. See AboutData for review comments.

SPINE LCI dataset: Resistor for hole mounting assembly

Administrative	
Finished	Y
Date Completed	2000-02-18
Copyright	Ericsson
Availability	Official

Technical System	
Name	Resistor for hole mounting assembly
Functional Unit	One gram resistor intended for hole mounting
Functional Unit Explanation	The motivation for choosing this functional unit is: · suitable unit to work with in an LCA of a private branch exchange (a complicated telecom product) · important component of the MD110 product system and many other electronic products. DESIGN Both answers from component manufacturer one (CM1) and component manufacturer two (CM2) are for exactly the same component. These facts are based on Ericsson technical specification of the component. Ericsson product number: REP 264 Ericsson description: Metal film resistor General technical specification The resistor consists of a ceramic rod on which a vacuum evaporated metal film is on deposited. The terminals are of tinned copper. The resistor shall be coated with several layers of laquer, which provides electrical, mechanical and climate protection. Dimensions: resistor size 0207 Weight: about 0.3 grams Clean leads can be accepted. Diameter: 1.9 - 2.5 mm Terminal diameter: 0.57 - 0.63 mm Length of resistor body: 5.0 - 7.0 mm
Process Type	Gate to gate
Site	Not relevant
Sector	Manufacturing
Owner	Not relevant
Technical system description	This activity includes the final assembly of a resistor intended for hole mounting. . The activity is an average based on information acquired from two manufacturers. The description of the process is supplied by manufacturer one, but is assumed to be general for this type of manufacture. The following process steps are included; 1. Incoming material

	2. Incoming inspection 3. Ceramic rods 4. Preparation of ceramic rods for deposition processes 5. Deposition material 6. Deposition of metal film 7. Ageing 8. Release test of deposited lots 9. Capping 10. Endcaps 11. Classifying according to R-value (not stated by this manufacturer, CM1, what R-value is. I suppose it is the resistor value of the resistor) 12. Intermediate stock 13. Laser sprialing 14. Release test of spiralled lots 15. Leads 16. Welding of leads 17. Welding strength test 18. Laquer, marking ink and taping material 19. 100 % electrical overload test, coating, marking, 100 % non-linearity ltest, 100% R value test, taping, visual inspection 20. Packaging material 21. Packaging and labelling 22. Lot release test. 23. Shipping department No detailed description was given by manufacturer one. Manufacturer two did not give any information about process steps.

System Boundaries	
Nature Boundary	Emissions to air, water and soil are excluded due to lack of data.
Time Boundary	1997 The answer from the manufacturer arrived in 1998 and they measured in 1997. The process technology used is most certainly the best available as the factories are located in western Germany and the companies are well established.
Geographical Boundary	The technical system for this model is limited to the factory where the production takes place. The manufacturers included in the average are located in Germany.
Other Boundaries	Delimitations to the system is the final step in the making of the HMD resistor. The production of the subparts (e.g. ceramic, caps, leads and targets) of the resistor is not included in this model The transportation of them to the factory is not included. For interested parties who wish to include the transport figures given from the manufacturers, can find the figures in the section Applicability. For component manufacturer one, the packaging materials for the incoming raw material have not been included.
Allocations	The manufacturers have not described how the allocation has been made. We did not decide or have any suggestions on how the manufacturer should allocate in their factory. Component manufacturer two (CM2) manufacture several models of resistors and found it impossible to allocate the energy-ware input to e.g. leaded resistors. The electricty consumption per component is well acertained by both manufacturers.
Systems Expansions	None.

Flow Data	
General Activity QMetaData	
Date Conceived	1997
Data Type	Derived, unspecified
Represents	Not relevant.
Method	The data that are presented are calculated as a average based on information from two component manufacturers. The information from the manufacturers were acquired using a LCI data questionnaire. The average for each presented flow is calculated as follows: - First the amount of each flow per functional unit is calculated for each component manufacturer - Then the calculated amount for each component manufacturer is summed for each unique flow and divided by the number of included component manufacturers'' In the information supplied by the capacitor manufacturers, they had indicated whether the data for each flow were measured, estimated or calculated. Below is a detailed account of the calculation procedure. Definition of variables: CMn: Component manufacturer number n. Myn: Materials, emission, waste, energy (y) given in component answer n. ACyn: Amount of

	material y in component material declaration, expressed in mg (or similar) by component manufacturer n Wn: Weight of one piece of component, expressed in mg (or similar) by component manufacturer n. Nyn: The flow y expressed per functional unit from manufacturer n. Step 1. For CM1 sum AC1+..+.ACn Step 2: The sum AC11+..+.ACyn = W1 Step 3: Divide all flows between M11...M1n by W1 --> N11...N1n Step 4: Repeat Step 1 to 3 for all component manufacturers and for each flow. Step 5: Sum N1n+..Nyn and divide by the number of terms for each unique flow.(material input, emission etc.) An average calculation like above of up to two answers was made.

About Inventory	
Publication	Not available -- Data documented by: Anders Andrae, Ericsson Business Networks AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The intended use for this LCI
General Purpose	The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks. The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system. The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB. Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts. The main purpose of the study for Ericsson is; to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the internal work with an Environmental Management System for Ericsson Enterprise Systems. Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson. The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.
Detailed Purpose	Map a resistor manufacturing/assembly process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the final assembly of HMD resistors and resembling components in our telecom products. The usage for this set of data are life cycle assessments where resistors intended for hole mounting are part of the studied system. Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX. The division into component groups is based on structural resemblance, electrical function and material contents of the different components. -- Below is a list of the component groups and corresponding models that have been compiled: 1. Cables - Model: Cable assembly 2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly 3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly 4. Connectors and holders - Model: Connector assembly 5. Diodes - Model: Diode wafer production and assembly

	6. Display units and indicators - Model: Liquid crystal display assembly 7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked) 8. Other - Model: ''Other'' electronic component assembly 9. Potentiometers - Model: Potentiometer assembly 10. Printed boards - Model: Printed board assembly 11. Relays - Model: Relay assembly 12. Resistor networks - Model: Resistor network assembly 13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly 14. Resistors; surface mounted devices - Model: Resistor for surface mounting assembly 15. Transformers and inductors - Model: Inductor assembly 16. Transistors and opto couplers (2 models) - Models: 1. Transistor assembly and 2. Si wafer production and Si wafer processing for transistors (these models are interlinked)
Commissioner	- Ericsson .

Reviewer	Pålsson, Ann-Christin - CPM Chalmers University of Technology S-412 96 Göteborg Sweden
Applicability	This set of data can be applied to resistors intended for hole mounting in electronic equipment if you know how much the resistors weigh. The model is also intended to be representative for varistors and thermistors for hole mounting in electronic equipment. -- Transports.-- Here follows a more detailed description of transports of materials and components to the respective manufacturer factories. These transports are not included in the model. CM1 = Component manufacturer one The calculation for all modes of transport is done like this: First the total transportation work per functional unit is calculated for each included component manufacturer. Then the total transportation is summed and divided by the number of included component manufacturers. This gives the average value for transportation by each mode of transport. -- Truck transportation: -- Component manufacturer one (CM1): Weight of component: 0.227 g Ceramics with weight 0.0416 g is transported 30 km by road i.e. 0,0416 g*30 km, Metal film 0.0003 g*148 km, Metal caps 0.0288 g*492 km, Cover 0.0058 g*700 km and Wire 0.1423 g*541 km. The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives: 96.5 gkm/0.227 g = 425.15 gkm/g Component manufacturer two (CM2): Weight of component: 0.219571 g Ceramics with weight 0.04184 g is transported 950 km by road i.e. 0,04184 g*950 km, Package 0.024 g*100 km, Metal caps 0.02837 g*300 km, Targets NiCr 0.0007 g*650 km and Lead wire 0.14457 g*550 km. The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives: 130.63 gkm/0.219571 g = 594.92 gkm/g This gives the average total transportation work by truck for CM1 and CM2: (CM1+CM2)/2= 510.04 gkm/g
About Data	The data is based on information from two German manufacturers. The information was gathered using a life cycle inventroy questionnaire. All flows are not average values and where there were only one manufacturer stating a certain flow, this one was chosen in the model.

	Of the flows about little more than 50 % are not average values.The flows for Raw material input of Al2O3, Cr, Cu, Epoxy resin, Fe, Ni, SiO2 and Sn are average values. In specific QMetaData for each flow, we have indicated specifically for each flow how many manufacturers have been included. The figures in the original answer from the manufacturers should all have a special tag telling if the value has been calculated, measured or estimated or a combination of two or three of them. Ericsson specifically told the manufacturers to do so. 100 % of the flows stated by CM2 have been just measured. CM1 have not stated any information about the flows. The outline of the LCI data questionnaire that were used in the inventory follows below. No limitations or specifications were set for which substances they had to account -- LCI data questionnaire -- Transport description: Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km). We here only asked for flows exceeded 2% by weight of the material declaration of the component. Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes.´ Process description. Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gatherd it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (e.g. planned changes in production rate) Material, components and natural resource input, etc. We told them to express data in amount per functional unit. Name of material, component or resource. Used amount(mg). Amount In Product(mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production site (address). Suppliers of transport (address). Additional information. Emissions. Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information. Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information. Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information. Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.

Copyright	Ericsson
Availability	Official

Technical System	
Name	Resistor for surface mounting assembly.
Functional Unit	One gram resistor intended for surface mounting
Functional Unit Explanation	The motivation for choosing this functional unit is: · suitable unit to work with in an LCA of a private branch exchange (a complicated telecom product) · important component of the MD110 product system and many other electronic products. DESIGN Both answers from component manufacturer one (CM1) and component manufacturer two CM2 are for exactly the same component. These facts are based on Ericsson technical specification of the component. Ericsson product number: REP 615 Ericsson description: Chip resistor General technical specification The resistor is intended for surface mounting and consists of a ceramic substrate where a resistor element is applied. The termination layer must contain a nickel barrier. Dimensions: resistor size 1206 Weight: about 9 milligrams (0.009 g) Length of resistor body: 3.2 mm Width: 1.6 mm Thickness: 0.55 mm
Process Type	Gate to gate
Site	Not relevant
Sector	Manufacturing
Owner	Not relevant
Technical system description	This activity includes the final assembly of a resistor intended for surface mounting. The activity is an average based on information acquired from two manufacturers. The description of the process is supplied by manufacturer one, but is assumed to be general for this type of manufacture. The following process steps are included; 1. Incoming inspection 2. Bottom termination printing 3. Top termination printing 4.. Resistive body printing 5. Glass coat printing 6. Laser trimming 7. Protective coat printing 8. Substrate stripping 9. End termination forming 10. Chip break 11. Plating 12. Taping 13. Final inspection No detailed description was given by manufacturer one. Manufacturer two did not give any information about process steps. Recycling information: According to component manufacturer one (CM1), silver and palladium are recycled within the process:

	Silver: 21.26 mg/9.271 mg = 2.29 g/g product output. Palladium: 0.0013 mg/9.271 mg = 0.00014 g/g product output.

System Boundaries

Nature Boundary	The emissons to air have nature as recipient. Each parameter mentioned by the component manufacturers has been studied. No parameter has deliberately been disregarded when environmental impact has been studied. Included component manufacturers have not specified the same parameters. In the cases where only one manufacturer has stated a parameter this has been used. Emissions to water are not included due to lack of data.
Time Boundary	1998 The answer from the manufacturer arrived in 1998 but none of them have specified when they measured. The process technology used is most certainly the best available as the factories are located in Japan and Israel respectively and the companies are well established.
Geographical Boundary	The technical system for this model is limited to the factory where the production takes place. The manufacturers included in the average are located in Japan and Israel.
Other Boundaries	Delimitations to the system is the final step in the making of the SMD resistor. The production of the subparts (e.g. Substrate, Epoxy resin ink, Resistive ink, Termination ink and Glass ink) of the resistor is not included in this model The transportation of them to the factory is not included. For interested parties who wish to include the transport figures given from the manufacturers, can find the figures in the section Applicability. For component manufacturer two, the packaging materials for the incoming raw material have not been included.
Allocations	The manufacturers have not described how the allocation has been made. We did not decide or have any suggestions on how the manufacturer should allocate in their factory.
Systems Expansions	None.

Flow Data

General Activity QMetaData

Date Conceived	1998
Data Type	Derived, unspecified
Represents	Not relevant.
Method	The data that are presented are calculated as a average based on information from two component manufacturers. The information from the manufacturers was acquired using a LCI data questionnaire. The average for each presented flow is calculated as follows: - First the amount of each flow per functional unit is calculated for each component manufacturer - Then the calculated amount for each component manufacturer is summed for each unique flow and divided by the number of included component manufacturers In the information supplied by the manufacturer, they had indicated whether the data for each flow were measured, estimated or calculated. Below is a detailed account of the calculation procedure. Definition of variables: CMn: Component manufacturer number n. Myn: Materials, emission, waste, energy (y) given in component answer n. ACyn: Amount of material y in component, expressed in mg (or similar) by component manufacturer n Wn: Weight of one piece of component, expressed in mg (or similar) by component manufacturer n. Nyn: The flow y expressed per functional unit from manufacturer n. Step 1. For CM1 sum AC1+..+.ACn Step 2: The sum AC11+..+.ACyn = W1 Step 3: Divide all flows between M11...M1n by W1 --> N11...N1n Step 4: Repeat Step 1 to 3 for all component manufacturers and for each flow. Step 5: Sum N1n+..Nyn and divide by the number of terms for each unique flow.(material input, emission etc.) An average calculation like above of up to two answers was made.

About Inventory

Publication	Not available -- Data documented by: Anders Andrae, Ericsson Business Networks AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The intended use for this LCI
General Purpose	The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks. The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system. The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB. Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts. The main purpose of the study for Ericsson is; - to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and - to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the

	internal work with an Environmental Management System for Ericsson Enterprise Systems. Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson. The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.
Detailed Purpose	Map a resistor manufacturing/assembly process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the final assembly of SMD resistors and resembling components in our telecom products. The usage for this set of data are life cycle assessments where resistors intended for surface mounting are part of the studied system. Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX. The division into component groups is based on structural resemblance, electrical function and material contents of the different components. -- Below is a list of the component groups and corresponding models that have been compiled: 1. Cables - Model: Cable assembly 2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly 3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly 4. Connectors and holders - Model: Connector assembly 5. Diodes - Model: Diode wafer production and assembly 6. Display units and indicators - Model: Liquid crystal display assembly 7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked) 8. Other - Model: ''Other'' electronic component assembly 9. Potentiometers - Model: Potentiometer assembly 10. Printed boards - Model: Printed board assembly 11. Relays - Model: Relay assembly 12. Resistor networks - Model: Resistor network assembly 13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly 14. Resistors; surface mounted devices - Model: Resistor for surface mounting assembly 15. Transformers and inductors - Model: Inductor assembly 16. Transistors and opto couplers (2 models) - Models: 1. Transistor assembly and 2. Si wafer production and Si wafer processing for transistors (these models are interlinked)
Commissioner	- Ericsson .
Practitioner	Andrae, Anders - Ericsson Business Networks AB Augustendalsvägen 21 S-131 89 Stockholm Office: Nacka Strand .
Reviewer	Pålsson, Ann-Christin - CPM Chalmers University of Technology S-412 96 Göteborg Sweden
Applicability	This set of data can be applied to resistors intended for surface mounted resistors in electronic equipment if you know how much the resistors weigh. -- Transports.-- Here follows a more detailed description of transports of materials and components to the respective manufacturer factories. These transports are not included in the model. CM1 = Component manufacturer one The calculation for all modes of transport is done like this: First the total transportation work per functional unit is calculated for each included component manufacturer. Then the total transportation is summed and

divided by the number of included component manufacturers. This gives the average value for transportation by each mode of transport.

-- Truck transportation: --

Component manufacturer one (CM1):

Weight of component: 0.009271 g

Substrate with weight 0.008 g is transported 200 km by road i.e. 0.008 g*200 km, Epoxy resin ink 0.00014 g*300 km, Resistive ink 0.00011 g*300 km, Termination ink 0.0003 g*300 km and Glass ink 0.00011 g*300 km.

The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:

1.798 gkm/0.009271 g = 193.93 gkm/g

Component manufacturer two (CM2):

Weight of component: 0.009 g

Ceramics with weight 0.0089 g is transported 30 km by road i.e. 0.0089 g*30 km, Stat. contact 0.0001 g*300 km, Metal film 0.0001 g*158 km, Glas cover 0.00005 g*380 km, Cover 0.00004 g*700 km and Lead wire 0.0002 g*300 km.

The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:

0.4198 gkm/0.009 g = 46.64 gkm/g

This gives the average total transportation work by truck for CM1 and CM2:

(CM1+CM2)/2= 120.29 gkm/g

-- Boat transportation: --

Component manufacturer one (CM1):

Weight of component: 0.009271 g

Resistive ink 0.00011 g*300 km.

The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:

0.033 gkm/0.009271 g = 3.56 gkm/g

About Data

The data is based on information from one Japanese manufacturer and one Israelic manufacturer. The information was gathered using a life cycle inventory questionnaire.

All flows are not average values and where there were only one manufacturer stating a certain flow, this one was chosen in the model.

Of the flows about little more than 73 % are not average values.The flows for Raw material input of Ag, Al_2O_3, Ni, RuO_2 and SiO_2 are average values.

In specific QMetaData for each flow, we have indicated specifically for each flow how many manufacturers have been included.

The figures in the original answer from the manufacturers should all have a special tag telling if the value has been calculated, measured or estimated or a combination of two or three of them. Ericsson specifically told the manufacturers to do so.

83 % of the flows stated by Component manufacturer one (CM1) and Component manufacturer two (CM2) have been just estimated. 8 % have been measured, 6 % have have no tag and 3 % are calculated.

The outline of the LCI data questionnaire that were used in the inventory follows below. No limitations or specifications were set for which substances they had to account

-- LCI data questionnaire --
Transport description:
Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km).

We here only asked for flows exceeded 2% by weight of the material declaration of the component.
Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes.´

Process description.

	Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gatherd it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (e.g. planned changes in production rate) Material, components and natural resource input, etc. We told them to express data in amount per functional unit. Name of material, component or resource. Used amount(mg). Amount In Product(mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production site (address). Suppliers of transport (address). Additional information. Emissions. Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information. Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information. Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information. SPINE LCI dataset: Resistor network assembly

Administrative	
Finished	Y
Date Completed	2000-03-15
Copyright	Ericsson
Availability	Official

Technical System	
Name	Resistor network assembly
Functional Unit	One gram resistor network intended for hole mounting
Functional Unit Explanation	The motivation for choosing this functional unit is: · Suitable unit to work with in an LCA of a private branch exchanges (a complicated telecom product) · Important component of the MD110 product system and many other electronic products. Ericsson product number: RER 601 03/37 Ericsson description: Resistor network Single in line package (SIP), low profile, common terminal type. The resistor network consists of a ceramic substrate an 4, 5, 8, 9 or 10 thick film resistors of equal value, each connected to a common bus and a separate pin. Material

	Frame: Polyester Contacts: Phosphorous bronze Surface treatment: Contact area: 1.27e-6 m Au on 1.27e-6 m Ni. Soldering tags: 2e-6 m SnPb on 1.27e-6 m Ni. Dimensions: Height: 5.08 mm, Length: 12.7 mm, Width: 2.5 mm, Terminal thickness: 0.25 +/- 0.1 mm
Process Type	Gate to gate
Site	Not relevant
Sector	Manufacturing
Owner	Not relevant
Technical system description	This activity includes the final assembly of a resistor network. Details on the production is not available. Note; This model is not based on information acquired from resistor network manufacturers. However, the electricity and oil use for the production has been approximated using information describing an other component; a hole mounted resistor.

System Boundaries

Nature Boundary	Emissions to air and water have been excluded due to lack of data.
Time Boundary	This model is intented to represent the assembly of resistor network in western Europe.
Geographical Boundary	This model is intended to represent the assembly of resistor networks in western Europe.
Other Boundaries	Delimitation's to the system is the final step in the making of the resistor network. The production of the subparts (e.g. frame, contacts and surface treatment) of the resistor network is not included in this model. The transportation of them to the factory is not included.
Allocations	Not relevant.
Systems Expansions	None.

Flow Data

General Activity QMetaData

Date Conceived	1998
Data Type	Derived, unspecified
Represents	Not relevant.
Method	Presented data for raw material input is based on a material declaration for a resistor network. Only amounts in product are presented, i.e. no waste is included. The electricity and oil use have been approximated using the average electricity use for production of hole mounted resistors. See Specific QMetaData for Electricty and Oil for a further description. Details on the production of hole mounted resistors can be found in the model ''hole mounted resistors production''.
Literature Reference	
Notes	The LCI model for HMD resistors has been taken as valid for resistor networks.

Practitioner	Andrae, Anders - Ericsson Business Networks AB Augustendalsvägen 21 S-131 89 Stockholm Office: Nacka Strand .
Reviewer	Pålsson, Ann-Christin - CPM Chalmers University of Technology S-412 96 Göteborg Sweden
Applicability	This set of data can be applied to resistor networks intended for mounting on PC-board in electronic equipment if you know how much the resistor networks weigh.
About Data	The value for electricity and oil use is approximated using information acquired from one manufacturer of a hole mounted resistor, described in the model ''Hole mounted resistor production''. The reason for this approximation is that we did not get any usable answer from resistor network manufacturers. Of all the eighteen models, resistor networks are most similar to the hole mounted resistors. The raw material input figures have their origin in material declaration of resistor networks developed at Ericsson. This means that only the amounts included in the product are presented. No waste is included.
Notes	

SPINE LCI dataset: Retapping of cooling medium in tanks

Administrative	
Finished	Y
Date Completed	1997-03-01
Copyright	
Availability	Public

Technical System	
Name	Retapping of cooling medium in tanks
Functional Unit	ton
Functional Unit Explanation	1 ton freon (chlorofluorocarbons): 1,23% CFC, 46,9% HCFC and 51,9% HFC
Process Type	Gate to gate
Site	H Jessen Jurgensen AS Aröds Industriväg 70 422 43 Hisingsbacka Sweden
Sector	Waste treatment
Owner	H Jessen Jurgensen AS Aröds Industriväg 70 422 43 Hisingsbacka Sweden
Technical system description	The retapping of the cooling media (gas) is done in five steps: 1. HCFC22 and HFC134A are delivered in 20 ton transporting tanks and are tapped off into two 26 meters storing tanks. The rest of the gas is delivered in cylinders of the sizes 5, 10, 60 or 800 kg. 2. The retapping is done into tanks as above. The delivery amount is measured by weighing. 3. The gas reclaimed by the company is analysed gas cromatography. The one component gases CFC12, CFC502, HCFC22 and HFC134A are recycled as often as possible. When recycled the gas is filtered twice. 4. Reclaimed gas cylinders, brought to the company to be retapped, are cleansed by steam washing, when needed, after evacuated the cooling media. 5. Filled gas tanks are stored to be delivered to customers. The delivered tanks are protected by plastic shields.

System Boundaries	
Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden

SPINE LCI dataset: Ring processes at SKFs site in Göteborg

Administrative	
Finished	Y
Date Completed	02-12-31
Copyright	
Availability	Public

Technical System	
Name	Ring processes at SKFs site in Göteborg
Functional Unit	Steel rings, 858.5 kg.
Functional Unit Explanation	'Steel rings' includes one outer ring and one inner ring for SKF bearing 232/530 One SKF spherical roller bearing 232/530 consists of following components: 1. one inner ring 2. one outer ring 3. one guide ring 4. one brass cage 5. 36 rollers (coated or non-coated) The functional unit for this process is one inner ring 232/530 IR, 356 kg and one outer ring 232/530 OR, 387 kg.
Process Type	Gate to gate
Site	SKF Large Bearings
Sector	Materials and components
Owner	SKF Large Bearings

Technical system description	This activity describes a process step included in the system ''Production of bearing rings'', also available in the SPINE@CPM database. Ringprocesses at SKFs site in Göteborg is the last step in the production of bearing rings and the rings are processed into desired shape and quality. The hard treatment begins with grinding. Both sides on both rings are ground because of the need of reference surfaces when inspected with ultra sound. Additional material is turned off and the scrap is sent back to Ovako Steel AB, Sweden for recycling. After the turning the inner ring is polished and the outer ring is ground once again. This is the only difference between the two rings in the process at SKFs site in Göteborg. The jacket surface of the outer ring is spherically ground to be able to hold the rollers in place. In this step the outer ring also obtains its checked pattern on the inside, so that the lubricant can spread easily on the steel surface. The rings are now ready for assembling. Observe that this is only the last process step for the production of bearing rings. The complete environmental impact can be seen in ''Production of bearing rings'' in the SPINE@CPM database.

System Boundaries

Nature Boundary	Emissions to air is not measured and could therefore not be reported in this study. The steel scrap from the process at SKF, Göteborg is sent to Ovako Steel in Hofors for recycling and is therefore not seen as waste, but a co-product to the technosphere.
Time Boundary	The data was collected during the autumn 2002, and no changes in the procedure are planned for the nearest future.
Geographical Boundary	The process is site specific for SKF in Göteborg, Sweden.
Other Boundaries	The electricity production is NOT included in this dataset but must be traced from its cradle. Internal transport 1 km with electric truck is included in the electricity consumption. BeTe Truck AB in Sweden has estimated the consumption of an electric truck: 0,75 kWh/km. The mineral oil in the cutting fluid (used at SKFs site in Göteborg) should be traced back to its cradle. The cutting fluid is an emulsion consisting of 4 % Castrol SW 3420. Castrol SW 3420 consists of 40% mineral oil according to the product data sheet (Castrol SW 3420). The amount of mineral oil must be accounted for to get the total environmental impact. The activities ''Extraction of crude oil'' and ''Refining of crude oil'' can be used from SPINE@CPM. The mineral oil in the emulsion should also be traced to its grave. It is separated from the water content and burnt in Halmstad and used as energy source for the cement industry. The activity ''Combustion of waste'' from SPINE@CPM database can be used.
Allocations	Energy consumption depends on how long the rings need to be processed in the processing equipment. This varies according to weight, but also according to size and desired properties of the final product. Allocations have been made according to weight and production
Systems Expansions	Not applicable

About Inventory	
Publication	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ----------- Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Data reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.
Intended User	Product developers at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.
Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Helene Berg - .
Reviewer	Olle Ramnäs -
Applicability	Much of the data is estimated specifically for the rings of these dimensions. The data should therefore be used carefully and can't be applied generally for ring processes.
About Data	Data is gathered from interviews with Thomas Lundberg, SKF Large Bearings AB, Sweden.
Notes	

SPINE LCI dataset: RME combustion in heavy duty truck or bus, Euro V, tank-to-wheel, f3 fuels

Administrative	
Finished	Y
Date Completed	2013-11-30
Copyright	f3 - Swedish Knowledge Centre for Renewable Transportation Fuels
Availability	Public

Technical System	
Name	RME combustion in heavy duty truck or bus, Euro V, tank-to-wheel, f3 fuels
Functional Unit	1 MJ
Functional Unit Explanation	1 MJ input of RME to vehicle tank
Process Type	Gate to grave
Site	
Sector	Fuel
Owner	
Technical system description	The data represent emissions from RME combustion in heavy duty truck or bus, Euro V, tank-to-wheel. The emission legislation uses the definition of a heavy duty vehicle having a gross weight of 3.5 tons or more. The reported emission factors should be considered as generic data, and it should be noted that the emissions for a specific vehicle and a specific mission might differ from those generic data. For example, the limit values for certification of engines have been used as basis for deriving some of the emission factors. The duty cycles used for certification are defined to cover the whole range of typical loads of an engine in different operations. The operation of a specific vehicle can however differ from the duty cycle used in the certification, resulting in different emissions than calculated with the generic emission factors. E.g. for the regulated emissions: nitrous oxides, particles, total organic compounds and carbon monoxide, the values are conservative based on the maximum emissions limits per kWh of engine output when driving at the best point (the optimal engine speed/torque operating point). In reality, the values are often lower.

Method	The emission factors (EF, kg/MJ) for the regulated emissions have been estimated based on ETC (transient test cycle for truck and bus engines), legislation limits for Euro V (2005/55/EC). The ETC cycle is for heavy duty engines and vehicle (www.dieselnet.com). Equation for calculation of emission factors for fuel use: Efficiency: 0.44 (?)= (energy work/energy in fuel) which is the efficiency at the best point (the optimal engine speed/torque operating point) and which gives the maximum emission factors within the legislation limit. EF fuel use (g/MJ)=EF work (g/kWh)/3.6*? Emissions of CO2 and SO2 have been calculated based on carbon- and sulphur content in the fuel, see documentation "Data compilation method for a specific flow" and "Reference" in the Flow table. Emissions of CH4 was calculated from JRC (2013) and N2O was best estimate.

SPINE LCI dataset: Roll-on-roll-off vessel (RoRo)

Administrative	
Finished	Y
Date Completed	1998 08
Copyright	NTM
Availability	Public

Technical System	
Name	Roll-on-roll-off vessel (RoRo)
Functional Unit	1 tonkm
Functional Unit Explanation	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 50 % for tankers, 80 % for RoRo vessles and 60% for other vessles. This is concidered representative for traffic to/from Sweden. *empty trips are included.*

Process Type	Gate to gate
Site	Sweden
Sector	Sea transport
Owner	Sweden
Technical system description	Operation of Roll-on-roll-off vessel (RoRo), including vessels between 2000-30 000 dwt (deadweight tonnes), with an 80% utilisation level.

System Boundaries

Nature Boundary	Regulated emissions to air are included. The parameters that are presented are: -regulated emissions for diesel engines: NOx, HC, particles and CO -fuel regulated: SO2 -tax regulated CO2. Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.
Time Boundary	The data represents the fleet in 1999.
Geographical Boundary	The data is based on Swedish conditions.
Other Boundaries	The average utilisation level is 50 % for tankers, 80% for RoRo vessles and 60% for other vessles 60% (including empty trips) *Parameters not considered* -Driving technique -External conditions e.g. climate etc. -Maintenance level of the vessel *Excluded subsystems* -Precombustion, i.e. production and distribution of the fuel. -Maintenance of the vessel (e.g. use of anti fouling) -After-treatment of the vessel -Handling of production rests
Allocations	N/A
Systems Expansions	N/A

Flow Data

General Activity QMetaData

Date Conceived	1998 - 09
Data Type	Derived, unspecified
Represents	NTM
Method	For each individual ship, the load capacity (in dwt), installed engine effect (in kW) (Redareföreningen 1995) and speed (in knots) have been used as a basis. The emissions have been calculated on the basis of the distribution of low and high revolution engines among the different size classes, and the emission factors of the engines (Alexandersson et al 1991), see table below. The energy consumption has been calculated with the assumption of an oil consumption of 200 g/kWh for both low and medium revolution engines. The emisson factors below are given in g/kWh, where kWh refer to mechanical work done by the engine. Engine type Load NOx CO CO2 THC PM Low rev 80% 17,7 0,2 600 0,8 0,9 Medium rev 80% 14 1 620 0,2 0,4 The utilisation levels used in these calculations are as follows: Tank 0,5 Bulk 0,6 RoRo 0,8 LoLo 0,6 Ferry 0,6 Others 0,6 The calculations of emissions from shipping are made according to the following principle: emission factor = spec.emission x effect x 1 x 1 speed load capacity utilisation level The *quantity value* for all parameters is an average of all vessels in the population. The *minimum value* corresponds to the individual with the lowest energy use and emissions in the population, and the *maximum value* to the individual with the largest energy use and emissions in the population. The *utilisation level* with regard to weight is 80%, based on Demker et al.
Literature Reference	-Alexandersson, A., *Sjöfartens utsläpp av avgaser*, MariTerm, TFB-rapport 1991:18 Demker, G. et al. *Miljöeffekter av transportmedelsval för godstransporter*, MariTerm, KFB-rapport, 1994:6 *Skeppsregister 1995*, Swedish Shipowner Association Sjöbris, A., Flodström, E. *Emissions och energivärderingsprinciper för transportsystem*, MariTerm, KFB-rapport 1994:9 *Lloyds list*, 1996
Notes	Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners´ Association may be obtained from Elisabeth Sörheim at the Swedish

	Shipowners´ Association.

About Inventory

Publication	www.ntm.a.se Data documented by: Magnus Blinge, Dept. for Transportation & Logistics, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology
Intended User	Suppliers and buyers of goods
General Purpose	There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business. The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation
Detailed Purpose	The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation) The ambition was to present a span constructed by a ''low'', an average and a ''high'' value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
Commissioner	- NTM.
Practitioner	Sörheim, Elisabet - Swedish Shipowners Association .
Reviewer	None, to be reviewed. -
Applicability	The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vessel, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out. Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners´ Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners´ Association or from the operators. ***Type of vessels***

	Cargo Vessles - includes all vessels except RoRo vessels and ferries. Cargo Vessles thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc. Cargo Vessles are mainly used for transportation of heavy goods over large distances. The energy use for tankers is generally lower than for other Cargo vessles. *RoRo vessels* are used for transportation of different types of load carriers such as trailers, containers etc. The cargo is rolled on the vessel. RoRo vessels generally operate at a higher speed than regular Cargo vessles. *Ferries* carry both passengers and goods. The goods are carried in trucks, trailers or trains. ***Fuel*** The fuel quality vary to a large extent between different vessels. Smaller vessels that only operate on Swedish routes generally use cleaner fuels. The main part of freighters in Swedish traffic use heavy fuel oil, with a sulphur content of 2,6 %. Small coastal freighters may however use gas oil with sulphur content of 0,1 %. Gas oil is the most refined type of fuel used in vessels (the maximum sulphur content is 1,5 %). In ferries, low sulphur fuel with sulphur content of 0,5 % is generally used. ***Reduction of emissions*** The data does not assume the use of any emission reducing measures. Different measures may be taken to reduce the emissions, e.g. water injection may reduce the emissions of NOx by 50%, and adjustments of the engine may reduce NOx emissions by 30 %. Catalytic converters may reduce NOx emissions by 90-100% and HC by 70-80%. Emissions of particles and HC are also reduced. Installation of catalytic converters is however a large investment for the shipowners. There are at present only a few vessels in Swedish traffic that has installed catalytic converters. The other measures constitute a smaller investment, and it is anticipated that the shipowners will chose these techniques to reduce emissions. ***Bulky goods*** Vessels generally handle transportation of large heavy goods over long distances. Some bulky goods are however transported by sea, primarily by RoRo vessels and ferries. The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m3. The conversion factor is generally accepted in the transportation business. ***Travelled distance*** The travelled distance of the goods may be estimated using a Nautic almanac, Lloyd. Since the utilisation level includes empty trips, no compensation in the distance for empty trips needs to be done. ***International sea transports*** When using the data for international traffic, the sulphur emissions should be adjusted, since the fuel quality may vary. Representative sulphur content of fuel used in international traffic is 3,3 %. The energy use and emissions of other parameters may also vary to a large extent depending on the quality of the fuel. The utilisation levels used in these calculations are as follows: Tank 0,5 Bulk 0,6 RoRo 0,8 LoLo 0,6 Ferry 0,6 Others 0,6
About Data	Data have been calculated on the basis of the load capacity (in dwt), installed engine effect (in kW) (Redareföreningen) and speed (in knots) (Lloyds) of each individual ship. Emissions to air per tonkm have been calculated by using the emission factors of the engines (Alexandersson et.al. 1991), see table below, and by knowing the relation of low and medium revolution engines to different sizes of ships. The emisson factors below are given in g/kWh, where kWh refer to mechanical work done by the engine. Engine type Load NOx CO CO2 THC PM Low rev 80% 17,7 0,2 600 0,8 0,9 Medium rev 80% 14 1 620 0,2 0,4 The energy consumption has been calculated by the assumption of an oil consumption of 200g/kWh for both low and medium revolution engines. The sulphurous content of the fuel is assumed to be 2.6% for cargo-ships (Sjöbris 1994).
Notes	The person stated as ''Practitioner'' is the contact person for the data for transportation by boat in NTM. The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se. The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.

	The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.

SPINE LCI dataset: RoRo vessel, 2000-30000 dwt

Administrative	
Finished	Y
Date Completed	1997-11-19
Copyright	NGM (Nätverket för Godstransporter och Miljön)
Availability	This version is only available to the members of NTM. The data is continously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se.

Technical System	
Name	RoRo vessel, 2000-30000 dwt
Functional Unit	1 tonkm, 80 %
Functional Unit Explanation	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 80%. An utilisation level of 80% is representative for Swedish domestic traffic if *empty trips are included.*
Process Type	Unit operation
Site	Sweden
Sector	Sea transport
Owner	Sweden
Technical system description	Operation i.e. propulsion of Swedish flagged RoRo vessel, which are members of the Swedish shipowners´ Association. The loading capacity is 2000 - 30000 dwt (deadweight tonnes).

System Boundaries	
Nature Boundary	Regulated emissions to air are included. The parameters that are presented are: -regulated emissions for diesel engines: NOx, HC, particles and CO -fuel regulated: SO2 -tax regulated: CO2. Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.
Time Boundary	The data represents the fleet in 1997
Geographical Boundary	The data is based on Swedish conditions.
Other Boundaries	The average utilisation level is 80% (including empty trips). *Parameters not considered* -Driving technique -External conditions e.g. climate etc. -Maintenance level of the vessel *Excluded subsystems* -Precombustion, i.e. production and distribution of the fuel. -Maintenance of the vessel (e.g. use of anti fouling) -After-treatment of the vessel -Handling of production rests
Allocations	N/A
Systems Expansions	N/A

Flow Data

General Activity QMetaData	
Date Conceived	1990-01-01 - 1997-01-01
Data Type	Derived, unspecified
Represents	NTM
Method	The basis for the data are all Swedish flagged RoRo vessels between 2000 and 30000 deadweight tonnes, which are members of the Swedish Shipowners' Association. The *quantity value* for all parameters is an average of all vessels in the population. The *minimum value* corresponds to the individual with the lowest energy use and emissions in the population, and the *maximum value* to the individual with the largest energy use and emissions in the population. The *utilisation level* with regard to weight is 80%, based on Demker et al. The energy use and emissions per tonkm for each vessel was calculated (see Specific QMetaData for each flow). For each vessel, the loading capacity was stated in deadweight tonnes (Skeppsregister 1995), installed engine power in kW (Skeppsregister 1995) and speed in knots (Lloyds list). The share of two-stroke and four-stroke engines in each vessel was determined by the size of the vessel according to Alexandersson. All vessels in the population were then used to calculate an average value.
Literature Reference	Alexandersson, A., *Sjöfartens utsläpp av avgaser*, MariTerm, TFB-rapport 1991:18 Demker, G. et al. *Miljöeffekter av transportmedelsval för godstransporter*, MariTerm, KFB-rapport, 1994:6 *Skeppsregister 1995*, Swedish Shipowner Association Sjöbris, A., Flodström, E. *Emissions och energivärderingsprinciper för transportsystem*, MariTerm, KFB-rapport 1994:9 *Lloyds list*, 1996
Notes	Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners´ Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners´ Association.

About Inventory

Publication	*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997,* NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997 -- Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology Documentation reviewed by: Elisabeth Sörheim, Swedish Shipowners' Association, contact person for sea transports in the work of NGM --
Intended User	Suppliers and buyers of goods
General Purpose	There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business. The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen

Detailed Purpose	The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives. The ambition was to present data for the ''best'', average and ''worst'' technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
Commissioner	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
Practitioner	Sörheim, Elisabeth - The Swedish Shipowners Association, Box 53046, S-400 14 Göteborg .
Reviewer	
Applicability	The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vessel, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out. The data for RoRo vessels and ferries should be used with great care. The utilisation level on these types of vessels may vary greatly, depending on how the goods are packed. Both volume and weight limited goods may be transported. The data for ferries are especially sensitive, since the distribution between goods and passengers may vary to a large extent between different ferries. The Swedish Shipowners´ Association recommends that data for RoRo vessels should be used when considering transport by ferry. Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners´ Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners´ Association. ***Type of vessels*** *Freighters* - includes all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc. Freighters are mainly used for transportation of heavy goods over large distances. The energy use for tankers is generally lower than for other freighters. *RoRo vessels* are used for transportation of different types of load carriers such as trailers, containers etc. The cargo is rolled on the vessel. RoRo vessels generally operate at a higher speed than regular freighters. *Ferries* carry both passengers and goods. The goods are carried in trucks or trains. ***Fuel*** The fuel quality may vary to a large extent between different vessels. Smaller vessels that only operate on Swedish routes generally use better fuels. The main part of freighters in Swedish traffic use heavy fuel oil, with a sulphur content of 2,6 %. Small coastal freighters may however use gas oil with sulphur content of 0,1 %. Gas oil is the most refined type of fuel used in vessels (the maximum sulphur content is 1,5 %). In ferries, low sulphur fuel with sulphur content of 0,5 % is generally used. Differentiated harbour dues on sulphur and NOx emissions were introduced in Sweden 1 January 1998. This will probably result in use of fuels of a better quality, primarily in ferries but also other freighters. ***Reduction of emissions*** The data does not assume the use of any emission reducing measures. Different measures may be taken to reduce the emissions, e.g. water injection may reduce the emissions of NOx by 50%, and adjustments of the engine may reduce NOx emissions by 30 %. Catalytic converters may reduce NOx emissions by 90-100% and HC by 70-80%. Emissions of particles and HC are also reduced. Installation of catalytic converters is however a large investment for the shipowners. There are at present only a few vessels in Swedish traffic that has installed catalytic converters. The other measures constitute a smaller investment, and it is anticipated that the shipowners will chose these techniques to reduce emissions. ***Bulky goods*** Vessels generally handle transportation of large heavy goods over long distances. Some bulky goods are however transported by sea, primarily by RoRo vessels and ferries. The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m3. The conversion factor is generally accepted in the transportation business. ***Travelled distance*** The travelled distance of the goods may be estimated using a Nautic almanac, Lloyd. Since the utilisation level includes empty trips, no compensation in the distance for empty trips needs to be done. ***International sea transports***

	When using the data for international traffic, the sulphur emissions should be adjusted, since the fuel quality may vary. Representative sulphur content of fuel used in international traffic is 3,3 %. The energy use and emissions of other parameters may also vary to a large extent depending on the quality of the fuel.
About Data	The data for emissions is derived from specific emission factors for the engine at a constant 80 % engine load. No test cycle was used to obtain the emission factors. There is however a small need for test cycles, since vessels generally operate at constant load on the engine during the sail. The fact that the engine load sometimes is lower than 80 % i.e. when sailing to and from the harbour has been neglected. This part is generally small but complicated. The calculation model may be used to calculate the energy use and emissions for a specific vessel if the loading capacity, installed engine power etc. is known. This information may be obtained from Skeppsregister. See QMetaData for details.
Notes	The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se. The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998. The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives. The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

SPINE LCI dataset: RoRo vessel, 2000-30000 dwt, future

Flow Data	
General Activity QMetaData	
Date Conceived	1997-01-01
Data Type	Derived, unspecified
Represents	
Method	The energy use and emissions was calculated using *assumptions* on energy saving and emission reducing actions together with data for existing individual vessels with the *lowest energy use and emissions* within the population of Swedish flagged RoRo vessels with loading capacity 2000-30000 tonnes, which are members of the Swedish Shipowners' Association vessels. The utilisation level with regard to weight is 80 %. The assumptions were given by the Swedish Shipowners' Association. The data for energy use and emissions for the vessels that was the basis for the calculation, and a description on how the data was obtained, can be found in the activity with ObjectOfStudy.Name: *RoRo vessel, 2000-30000 dwt* (in this database) or in ''Energi- och emissionsuppgifter för godstransporter''. The minimum value for the energy use and emissions was used in the calculation. The following percentages for the reduction of energy use and emissions was used in the calculation: -Oil

	consumption: 30 % (by different energy saving measures) -NOx: 93 % (through optimisation of the engine and catalytic converters) -HC: 88 % (by catalytic converters) -CO: 81 % (by catalytic converters) -Particles: 35 % The sulphur content in the fuel was assumed to be 0,09 %. Emissions of SO2 were calculated from the fuel consumption using the sulphur content in the fuel. Emissions of CO2 were calculated from the fuel consumption using the carbon content in the fuel.

SPINE LCI dataset: Sausage (Hot-Dog) production. ESA-DBP

Administrative	
Finished	Y
Date Completed	2005
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Sausage (Hot-Dog) production. ESA-DBP
Functional Unit	100 kg of 'Hot Dog'
Functional Unit Explanation	The average proteing content of the meat ingridients is 17,5%
Process Type	Gate to gate
Site	Swedish Meats, Örebro, Sweden
Sector	Crop and animal production, hunting etc.
Owner	Swedish Meats, Örebro, Sweden
Technical system description	Excerpt from the report, see 'Function': ''Sausages are common food in many countries, with a history that dates far back. In the beginning it was a way to preserve meat for a long time, and also to use the parts of the animal that could not be used as whole meat. (...) In co-operation with Swedish Meats, a production facility in Örebro, Sweden, was studied. The reason for choosing the particular facility was that it mainly produces one product, named Hot Dogs. (...) The main production process consists of eight processes, of which some may be divided into two or more steps: (...) 1. Grinding - Frozen products are thawed before use. The meat ingredients are ground, and an automatic device is used to supervise the fat content. 2. Pre-mixing - the meat mixture is mixed with water, ice, and salt. 3. Ripening in silo - storage of meat mixture, usually for 1-5 days. Six silos, each with a capacity of 12 tonnes. 4. Recipe mixing - mixing of meat mixture with other ingredients, such as potato starch and spices. A highly automated process, where the operator just defines the amounts, after which the mixture is prepared by the machine. 5. Extruding - four extruding machines, which are loaded with cellulose tubes. The sausage batter is extruded through the tubes at high speed, whereupon casing-covered sausages are formed. The cellulose casing is manufactured by Viscofan SA in Pamplona, Spain. Long strings of sausages are then cooked, smoked and cooled down. 6. Peeling of sausage strings - four parallel machines use steam to peel the casing off the sausages. 7. Packaging - six packaging lines with various capacity, each including several steps: positioning, vacuum packaging (big rolls of plastic wrapping are heat-moulded into shape, sausages are inserted, and the packages are sealed), scale/metal detector, (defective products are removed), picker (a fast robot loads the packages into plastic trays), robot loading trays on pallet. 8. Loading area - facility office; stock input to logistics software, and back-reporting of customer orders. The aim of this study has been to model real and present conditions. However, the manufacturers were not able to share their recipes and therefore the following recipes were used in this study: - Hot Dog, based on an estimate of the real recipe. - Pea Dog, a hypothetical product based on the Hot Dog recipe, but with 10% of the animal protein substituted for pea protein. - Soy Dog, a hypothetical recipe based on the contents and nutritional value of Dafgård's soy sausage, with a protein content of about 7%.'' This process is included in the system described in: Abelmann A. (2010). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf Other processes in the CPM Database also included in the above publication: - Sausage (Soy-Dog) production. ESA-DBP - Sausage (Pea-Dog) production. ESA-DBP - Operation of 'Hot Dogs' producing facility. ESA-DBP - Pea cultivation. ESA-DBP - Production of beef. ESA-DBP - Production of pork. ESA-DBP - Rape seed cultivation. ESA-DBP - Wheat cultivation. ESA-DBP - Sugar beet cultivation. ESA-DBP - Soy bean processing. ESA-DBP - Soy bean cultivation. ESA-DBP

System Boundaries	
Nature Boundary	Refined and natural resources as well as the energy use are included in the study.
Time Boundary	Excerpt from the report, see 'Publication': ''The goal has been to use as present data as possible. Most data on the Örebro facility is based on actual numbers from 2004.''
Geographical Boundary	The study was done for Sweden.
Other Boundaries	Excerpt from the report, see 'Publication': ''In order to simplify the recipe, different pork products have been aggregated into ''pork'', and beef products have in the same way been aggregated into ''beef''. In a real product, also ingredients such as ascorbic acid, lactate and acetate have to be added because of their function as preservatives and such; but as they usually make up very small shares of the product, they have been omitted from the recipe. (...) Not included are any aspects regarding personnel.''

Allocations	No information about the allocation in the report.
Systems Expansions	Not applicable

Technical System	
Name	Sausage (Pea-Dog) production. ESA-DBP
Functional Unit	100 kg of 'Pea Dog'
Functional Unit Explanation	The average proteing content of the meat ingridients is 17,5%
Process Type	Gate to gate
Site	Swedish Meats, Örebro, Sweden
Sector	Food products and beverages
Owner	Swedish Meats, Örebro, Sweden
Technical system description	Excerpt from the report, see 'Function': ''Sausages are common food in many countries, with a history that dates far back. In the beginning it was a way to preserve meat for a long time, and also to use the parts of the animal that could not be used as whole meat. (...) In co-operation with Swedish Meats, a production facility in Örebro, Sweden, was studied. The reason for choosing the particular facility was that it mainly produces one product, named Hot Dogs. (...) The main production process consists of eight processes, of which some may be divided into two or more steps: (...) 1. Grinding - Frozen products are thawed before use. The meat ingredients are ground, and an automatic device is used to supervise the fat content. 2. Pre-mixing - the meat mixture is mixed with water, ice, and salt. 3. Ripening in silo - storage of meat mixture, usually for 1-5 days. Six silos, each with a capacity of 12 tonnes. 4. Recipe mixing - mixing of meat mixture with other ingredients, such as potato starch and spices. A highly automated process, where the operator just defines the amounts, after which the mixture is prepared by the machine. 5. Extruding - four extruding machines, which are loaded with cellulose tubes. The sausage batter is extruded through the tubes at high speed, whereupon casing-covered sausages are formed. The cellulose casing is manufactured by Viscofan SA in Pamplona, Spain. Long strings of sausages are then cooked, smoked and cooled down. 6. Peeling of sausage strings - four parallel machines use steam to peel the casing off the sausages. 7. Packaging - six packaging lines with various capacity, each including several steps: positioning, vacuum packaging (big rolls of plastic wrapping are heat-moulded into shape, sausages are inserted, and the packages are sealed), scale/metal detector, (defective products are removed), picker (a fast robot loads the packages into plastic trays), robot loading trays on pallet. 8. Technical System	
Name	Sausage (Soy-Dog) production. ESA-DBP
Functional Unit	100 kg of 'Soy Dog'
Functional Unit Explanation	
Process Type	Gate to gate
Site	Swedish Meats, Örebro, Sweden

Sector	Food products and beverages
Owner	Swedish Meats, Örebro, Sweden
Technical system description	Excerpt from the report, see 'Function': ''Sausages are common food in many countries, with a history that dates far back. In the beginning it was a way to preserve meat for a long time, and also to use the parts of the animal that could not be used as whole meat. (...) In co-operation with Swedish Meats, a production facility in Örebro, Sweden, was studied. The reason for choosing the particular facility was that it mainly produces one product, named Hot Dogs. (...) The main production process consists of eight processes, of which some may be divided into two or more steps: (...) 1. Grinding - Frozen products are thawed before use. The meat ingredients are ground, and an automatic device is used to supervise the fat content. (NB: not applicable in case of Soy-Dog) 2. Pre-mixing - the meat mixture is mixed with water, ice, and salt. 3. Ripening in silo - storage of meat mixture, usually for 1-5 days. Six silos, each with a capacity of 12 tonnes. 4. Recipe mixing - mixing of meat mixture with other ingredients, such as potato starch and spices. A highly automated process, where the operator just defines the amounts, after which the mixture is prepared by the machine. 5. Extruding - four extruding machines, which are loaded with cellulose tubes. The sausage batter is extruded through the tubes at high speed, whereupon casing-covered sausages are formed. The cellulose casing is manufactured by Viscofan SA in Pamplona, Spain. Long strings of sausages are then cooked, smoked and cooled down. 6. Peeling of sausage strings - four parallel machines use steam to peel the casing off the sausages (NB: in case of Soy-Dog due to uncertainties of the feasibility of the recipe to actually hold together, the cellulose casing is not removed through the peeling process.) 7. Packaging - six packaging lines with various capacity, each including several steps: positioning, vacuum packaging (big rolls of plastic wrapping are heat-moulded into shape, sausages are inserted, and the packages are sealed), scale/metal detector, (defective products are removed), picker (a fast robot loads the packages into plastic trays), robot loading trays on pallet. 8. Loading area - facility office; stock input to logistics software, and back-reporting of customer orders. The aim of this study has been to model real and present conditions. However, the manufacturers were not able to share their recipes and therefore the following recipes were used in this study: - Hot Dog, based on an estimate of the real recipe. - Pea Dog, a hypothetical product based on the Hot Dog recipe, but with 10% of the animal protein substituted for pea protein. - Soy Dog, a hypothetical recipe based on the contents and nutritional value of Dafgård's soy sausage, with a protein content of about 7%. (...) Soy protein is the only plant protein which is 'complete', in the sense that it provides all the essential amino acids needed for human health. It is low in saturated fat and cholesterol-free. It is extracted from the soy bean, which is cultivated in temperate climates. Most of the Swedish and European soy is imported from Brazil in the form of soy meal and the lion's share of it is used in animal fodder. The most common vegetable sausage alternative is the soy sausage, which in Sweden is marketed by several manufacturers. The soy content usually consists of textured soy protein, which in turn consists of 70% protein and 23% dietary fibres. The concentrate is hydrolysed in order to obtain desirable properties. A presentation of the protein content in some soy products is shown below. Using the same yield as in the case of pea protein (65%) an amount of 3.6 kg of soy beans is needed to produce 1 kg of textured soy protein. As data on the protein extraction process is missing, the 'soy protein' input in the analysis is assumed to be equivalent to, and replaced by soy meal. The amount is based on protein level.'' This process is included in the system described in: Abelmann A. (2005). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf Other processes in the CPM Database also included in the above publication: - Sausage (Pea-Dog) production. ESA-DBP - Sausage (Hot-Dog) production. ESA-DBP - Operation of 'Hot Dogs' producing facility. ESA-DBP - Pea cultivation. ESA-DBP - Production of beef. ESA-DBP - Production of pork. Technical System	
Name	Sawed construction timber production
Functional Unit	kg
Functional Unit Explanation	1 kg sawed construction timber
Process Type	Cradle to gate
Site	Sweden, an area between Norrland (Piteå) and Småland (Möcklen)
Sector	Materials and components
Owner	Sweden, an area between Norrland (Piteå) and Småland (Möcklen)
Technical system description	The study comprises forestry, production of wooden material at the sawmill, transports from forest to sawmill and internal transports at the sawmill. The average transport distance between the forest and the sawmill is about 55 km.

System Boundaries	
Nature Boundary	Ashes from the sawmill are brought back to the forest and waste bark is used for road filling. This study includes environmental loadings such as material resource, resources for energy production, waste and emissions to air and water.

About Inventory

Publication	LCA of Building Frame Structures Environmental Impact over the Life Cycle of Wooden and Concrete frame; Björklund, Tillman; Report 1997:2; TEP; CTH; Göteborg; Sweden¨ --- Data documented by: Maria Erixon, project employed for the database project at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Thomas Björklund, Technical Environmental Planning, Chalmers University of Technology ---
Intended User	Environmental declaration
General Purpose	To survey the environmental load of sawed construction timber
Detailed Purpose	
Commissioner	
Practitioner	Björklund Thomas, Tillman Anne-Marie - Technical Environmental Planning, CTH 412 96 Göteborg Sweden.
Reviewer	
Applicability	Valid for timber with a moister content of 18 percent, which is normal for constructional timber at building sites of today. The density of unprocessed coniferous wood is 460 kg/m3 (dry substance). The function of the technical system is not sufficently described.
About Data	Average values from 16 Swedish sawmills inventory: Fiskarhedens Trävaru AB, Gällö Kilafors Trä AB, Gällö Såg, Kilafors Trävaru, Hissmofors AB, Kastets Sågverk, Korsnäs Timber AB, Kopparforsens Sågverk, STORA, Timber AB, Lövholmens Trä AB, Moelven Dala Trä AB, AB Möckels Sågverk, Nyby Sågverk Mälarskog Industrier AB, OLAB Trä, Östavallssågen SAEF AB, Siljans Sågverk AB, Skinnskattebergs Trä AB, Åtvidabergs Trävaru AB
Notes	-- --- Changes made to the data set after publishing in SPINE@CPM--- >>> 12 June 2001 <<< Changes made by Ann-Christin Pålsson, based on the original report (Björklund et al.). Comments: - A input flow of 'Feedstock energy' (18,2 MJ) in the flow table has been deleted due to that it represented the energy content of the product, and not a real physical flow. - Practitioner and Publication: Changed from Trätek, to Björklund Tillman, since the documentation in SPINE@CPM is based on the interpretation made by Björklund, Tillman. Some minor modifications of the report by Trätek has been made by Björklund Tillman. - Applicability; A text in refererring to Trätek for further information about the data set has been

SPINE LCI dataset: Scalable electric traction motor, permanent magnet (PMSM), for EVs

Administrative	
Finished	Y
Date Completed	2016-07-01
Copyright	Anders Nordelöf
Availability	Public

Technical System	
Name	Scalable electric traction motor, permanent magnet (PMSM), for EVs
Functional Unit	1 piece of electric traction motor, specified by its output in power (20-200 kW) and torque (48-477 Nm)
Functional Unit Explanation	
Process Type	Gate to gate
Site	
Sector	Process
Owner	
Technical system description	The dataset consists of a general and scalable LCI data model for a(n) (internal) permanent magnet synchronous electric motor, (I)PMSM, designed for electric vehicle propulsion. It provides the mass composition and manufacturing data for a typical automotive electrical machine design, as delivered at the factory gate. The model file generates data on motors ranging in power from 20-200 kW and in torque from 48-477 Nm, i.e. from a small electric passenger vehicle up to, for example, an electrically propelled bus. It is a gate-to-gate LCI, with inputs as delivered from various stages of material processing. All input and output flows have recommended matching output and input flows from LCI process datasets or elementary flows included in ecoinvent v 3. The LCI is possible to combine with input data for virgin raw materials as well as recycled materials. Use (operation and maintenance) and end-of-life treatment is NOT included in the dataset. Adjustable model parameters: * Maximum power (kW) * Maximum torque (Nm), allowing for base speeds within 3000-5000 rpm (default: 4000 rpm) * Inclusion/exclusion of electromagentically passive parts: housing (body and endbells on each side), shaft, bearings Input flows: * Products flows, as "product material input" (materials and subparts) and "processing input" (input to production, but not a part of the final product). * Energy use in production Output flows: * Product flow: 1 piece of electric motor * Waste - typically metal scrap, sludge or used process liquids * Emissions to air and water The model has been setup with a regular system boundary and an extended system boundary. The regular boundary encircles the inventoried gate-to-gate system. The latter encircles a set of ecoinvent activities for material transformation and coating included to account for the making of several subparts from their material constituents. These activities are listed separately from the inventory defined by the regular system boundaries, to avoid confusion for the user, see the model report. The model file presents an aggregated inventory list (and an aggregated activity list, see above) on the summary page, as well as all flows in and out of each unit process (including all internal flows of the gate-gate system). Extended system activities are also presented both aggregated (in a list on the summary page) and individually for each related flow. Finally, uncertainty has been quantified for all data on the unit process level (not for aggregated results) by the authors, based on qualitative assessment of data quality according to the ecoinvent pedigree matrix approach, see Appendix A of the model report. For a full description on the methodology, theory and data processing that has led to the inventory details presented in the model file, please read the model report.

SPINE LCI dataset: Scalable inverter unit, electric motor controller, IGBT transistors, for EVs

Administrative

Finished	Y
Date Completed	2018-10-02
Copyright	Anders Nordelöf
Availability	Public

Technical System	
Name	Scalable inverter unit, electric motor controller, IGBT transistors, for EVs
Functional Unit	1 inverter unit (piece) for electric motor control
Functional Unit Explanation	The inverter unit is scalable and specified by its output power (20-200 kW) and input DC system voltage (250-700 V).
Process Type	Gate to gate
Site	
Sector	Machinery and equipment
Owner	
Technical system description	The dataset consists of a general and scalable LCI data model for an inverter unit designed for electric vehicle motor control. It provides the mass composition and manufacturing data for a typical automotive inverter unit design containing IGBT transistors, as delivered at the factory gate. The model file generates data on inverter units ranging in power from 20-200 kW and DC system voltage from 250-700 V, i.e. from a small electric passenger vehicle up to, for example, an electrically propelled bus. It is a gate-to-gate LCI, with inputs as delivered from various stages of material processing. All input and output flows have recommended matching output and input flows from LCI process datasets or elementary flows included in ecoinvent v 3. The LCI is possible to combine with input data for virgin raw materials as well as recycled materials. Use (operation and maintenance) and end-of-life treatment is NOT included in the dataset. Adjustable model parameters: * Nominal power (kW), output on AC side * Nominal DC system voltage (V), input on DC side, typically from a battery * Selection of cooling method/type of heatsink: air cooling (up to 50 kW) or liquid cooling (complete range) * Inclusion/exclusion of parts with large design variability: casing (including integrated HV connectors) and laminated bus bar. Input flows: * Products flows, as "product material input" (materials and subparts) and "processing input" (input to production, but not a part of the final product). * Energy use in production Output flows: * Product flow: 1 piece of inverter / electric motor controller * Waste - typically metal scrap, sludge or used process liquids * Emissions to air and water The model has been setup with a regular system boundary and an extended system boundary. The regular boundary encircles the inventoried gate-to-gate system. The latter encircles a set of ecoinvent activities for material transformation, coating and assembly included to account for the making of several subparts from their material constituents. These activities are listed separately from the inventory defined by the regular system boundaries, to avoid confusion for the user, see the model report. The model file presents an aggregated inventory list (and an aggregated activity list, see above) on the summary page, as well as all flows in and out of each unit process (including all internal flows of the gate-gate system). Extended system activities are also presented both aggregated (in a list on the summary page) and individually for each related flow. For a full description on the methodology, theory and data processing that has led to the inventory details presented in the model file, please read the model report.

SPINE LCI dataset: Scrap-based aluminium production

Administrative

Finished	Y
Date Completed	1996-05-01
Copyright	[HOLDER OF COPYRIGHT]
Availability	AUTORIZATIONS AND SECRECY:

Technical System

Name	Scrap-based aluminium production
Functional Unit	kg
Functional Unit Explanation	Inventory result for production of 1 kg scrap-based aluminium.
Process Type	Cradle to gate
Site	
Sector	Materials and components
Owner	

Technical system description	BRIEF DESCRIPTION: The raw material used for the scrap-based aluminium production are NaOH, salt (NaCl), chlorine and scrap-aluminium. The production of these raw materials are calculated for in this study. The energy use at the production plant at Gotthard Aluminium in Älmhult, Sweden, is included. The transports of raw materials to the scrap-based aluminium production plant at Gotthard Aluminium in Älmhult, Sweden, are assumed to be standard distances and standars conveyance (that is, long distance road), except for transport of salt. The distances are for NaOH 300 km, salt 800 km (from Germany), chlorine 300 km and scrap 300 km.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: This study includes environmental loadings such as material resources, resources for energy production, waste and emissions to air and water.
Time Boundary	LIFETIME/APPLICABLE TIME OF SYSTEM/PRODUCT (delete the inappropriate alternative): The data is collected during the early nineties and one should consider some change i process steps etc. as times go.
Geographical Boundary	GEOGRAPHICAL EXTENSION (for large technical systems) The known processes takes place in Sweden (recycling process) and Germany (salt production). It is not known where the production of NaOH and chlorine takes place, but it is assumed to take place in Sweden. It is not known where the scrap is taken from.
Other Boundaries	
Allocations	DESCRIPTION: The allocations in this study is based on massflow.
Systems Expansions	N/A (unless aggregated system from special type of comparative LCI study) No.

About Inventory	
Publication	Life Cycle Assessment of Aluminium, Copper and Steel; Maria Sunér; Technical environmental planning; Report 1996:6; Chalmers University of Technology; Göteborg; Sweden. --- Data documented by: Maria Erixon, project employed at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology ---
Intended User	Anyone who wants to make a Lif
General Purpose	To make an LCA for Al, Cu and steel.
Detailed Purpose	The data is presented in the report Life Cycle Assessment of Aluminium, Copper and Steel. The purpose of the report was to collect and present inventory data on production and recycling of the three materials aluminium, copper and steel of higher quality than earlier published data.
Commissioner	
Practitioner	Sunér, Maria - Teknisk Miljöplanering Chalmers Tekniska Högskola 412 96 Göteborg Sweden.
Reviewer	

Applicability	CERTAIN CAUTIONS: The data for the recycling process in this study are from Gotthard Aluminium in Älmhult, Sweden. The data is taken mainly from their environmental report from 1993. During 1994 the company made several environmental improvements, which can change the environmental load calculated in this study. Data for virgin aluminium production is to be found in this database at Virgin aluminium production.
About Data	GENERAL DATA SOURCE DESCRIPTION: Data for the recycling process is taken from Gotthard Aluminium in Älmhult, Sweden. It is data from an Environmental Report. It is not known in what chemical form the metal emissions to air or water are. The NaOH and chlorine production is assumed to take place in Sweden and NaCl (mining and refining, that is crushing and grinding) in Germany.
Notes	

SPINE LCI dataset: Scrap-based steel production

Administrative	
Finished	Y
Date Completed	1996-10-01
Copyright	
Availability	Public

Technical System	
Name	Scrap-based steel production
Functional Unit	kg
Functional Unit Explanation	1 kg scrap-based steel
Process Type	Gate to gate
Site	Sweden
Sector	Materials and components
Owner	Sweden
Technical system description	The scrap-based steel production includes the following steps: Scrap refining; Production of slag formers; Coal mining; Steel production (scrap pre-heating, steel plant, casting of billets, rolling (fine and medium rolling)). The transports mentioned below are accounted for in this set of data. Scrap refining Scrap is transported 40 km by lorry from earlier user to scrap refining plant. All sorts of metals are received (brass, copper, aluminum etc.), but about 90% is iron and steel. In the refining process, scrap is sorted according to metal. Larger fragments are first cut down with gas beams and then cut into final suitable shape and taken to a steel plant. From the scrap refining plant the scrap is transported about 300 km by train. Production of slag formers Lime is transported from Rättvik, about 120 km with lorry. Coal mining Coal is imported from Finland, Germany and some other countries. It is transported to Stockholm or Västerås by boat, at the average 500 km, and then 180 km by lorry from Västerås and Stockholm to Smedjebacken.

System Boundaries	
Nature Boundary	This study includes environmental loadings such as material resources, resources for energy production, waste and emissions to air and water.
Time Boundary	
Geographical Boundary	Sweden, except for the coal mining which is done in Australia and USA.
Other Boundaries	

Allocations	Steel production The environmental load for cutting and bending is insignificant compared to total environmental impact of other process steps, and thus the total environmental load is allocated to products from the steel plant and the rolling mill. Rod iron profiles are main products, to which the environmental impact is allocated. Rolling As liquefied petroleum gas (LP gas) is mainly used in the rolling mills (though a minor part is used in the pre-heating of tun-dishes), its environmental impact is allocated to rolled products. Further, following parameters are allocated to production in the rolling mills: - All emissions to water - NOX (emission to air) - Chemicals (resource)
Systems Expansions

Applicability	
About Data	Scrap refining In 1994/95 the average energy use was about 0.046 MJ/kg scrap. It is assumed that all used energy is electricity. No process waste occurs. Production of slag formers For the calculations it is assumed that all slag formers consist of lime. Coal mining Half the amount of coal is imported from Australia and half from USA. The data used are average values for mineral coal used in Europe based on 50% open-pit mining and 50% underground mining. Steel production Filter dust (14.5 g/kg) and glow scales (11.6 g/kg) is defined as low-grade products and carry no upstream environmental impact. Both these products have an economical value and are used in other industrial processes. The filter dust mainly consists of iron and zinc. As alloy materials, mainly ferrosilicon manganese and ferrosilicon is used. The alloy materials are mainly bought from alloy plants in Norway, although the ore is mined elsewhere. The environmental impact of mining and extraction of alloy materials are treated

	as non-elementary flows. In coal and coke is also included some antracite electrodes. As coal and coke are primarily used as raw materials, these parameters are in the calculations accounted for primarily as material use and not as energy use. Chemicals are mainly used for water treatment, mostly aluminium sulphate and sodium hydroxide. Chemicals are treated as non-elementary flows. Ceramic materials used for mending the ovens are omitted in the calculations, as the amounts are negligible (0.697 g/kg). The environmental load of oxygen production (0.026 Nm3/kg steel) is treated as a non-elementary flow in the calculations, as no data have been easily available for this process. Some energy recovered in the process is transferred as heated water to the municipal district heating system (0.123 MJ/kg), and this energy has been deducted from the electricity use. CO2 emissions are calculated based on use of fossil fuels. It is assumed in the calculations that the fine- and medium-rolling mills are equal in environmental impact per produced weight unit.

Technical System	
Name	Scrap-based steel production
Functional Unit	kg
Functional Unit Explanation	Inventory result for production of 1 kg scrap-based steel billets.
Process Type	Gate to gate
Site	
Sector	Materials and components
Owner	
Technical system description	Included in the Scrap-based steel production: The steel production at Fundia Steel AB (in Smedjebacken, Sweden) is entirely based on scrap and no virgin steel is added. Scrap, alloy material, slag formers, coal and coke are used in the production of scrap-based steel. Limestone and bentonite are the raw materials in the slag former production. The raw material production are included in this study, except for scrap (the scrap is treated as an inflow not traced back to the cradle). Alloy material production includes mining and dressing. Coal and coke production includes coal mining. The steel are casted into billets in the steel plant. -- Coal is transported from Australia, Poland and USA to the coke production and the average distance is estimated to10 000 km by boat and 833 km by train. The transports of Scrap, Alloy material, Slag former, Coke and Coal to the steel plant is assumed to be 300 km by road (standard distances and modes of conveyance) respectivly.

System Boundaries	
Nature Boundary	Emissions to air and water, waste and natural resources.
Time Boundary	The data is collected during the early nineties and one should consider some change i process steps etc. as times go.
Geographical Boundary	The scrap-based steel production is, as well as the coke production, taken place in Sweden. The alloy material production, limestone and bentonite mining are assumed to take place in Sweden. Coal is imported from Australia, Poland and USA.
Other Boundaries	The scrap is treated as an inflow not traced back to the cradle.
Allocations	

Systems Expansions	No.

Practitioner	Sunér, Maria - Teknisk Miljöplanering Chalmers Tekniska Högskola 412 96 Göteborg Sweden.
Reviewer	
Applicability	
About Data	The data for the production of Scrap-basd steel at Fundia Steel AB is taken from their Environmental report 1994. Alloy material As alloy material manganese ore is assumed. As no data are available on manganese ore mining data valid for iron ore mining are used. The data on iron ore mining and dressing is taken from the production in Malmberget, Sweden (LKAB). Slag former The slag former is assumed to be composed of 50% limestone and 50% bentonite. Coal The data used for coal is litterature data. It is average data from Australia, Poland and USA. Coke The data used for coke production is taken from SSAB Tunnplåt in Luleå, Sweden. Limestone The data used for limestone mining is taken from Nordkalk Storugns on Gotland, Sweden. Bentonite Bentonite is imported from Greece. In this study bentonite mining is approximated to mining of limestone. Transports The following transports are assumed to be standard distances (300 km between the unknown consignor and Fundia Steel AB in Smedjebacken, Sweden), having standard modes of conveyance (road long distance): Scrap, Alloy material, Slag former, Coke and Coal. The data on emissions of particulates from the steel plant is modified according to the particulate composition (taken from the environmental report of Fundia Steel AB): Fe 34% Zn 24,8% Pb 3,0% Ca 2,9% Cu 0,2% Cr 0,2% Ni 0,03 % This equals to 66,15% and the residual, 33,85%, is assumed to be non-metal particulates. The metal emissions are not included in the parameter particulates, but accounted for separatly.

Technical System

Name	Seatbelt assembly. Autoliv ESA-DBP
Functional Unit	1 seatbelt
Functional Unit Explanation	1 seatbelt weighs 1129.865 grams
Process Type	Unit operation
Site	Autoliv ALH. Sopronkövesd, Hungary.
Sector	Manufacturing
Owner	Autoliv ALH. Sopronkövesd, Hungary.
Technical system description	The studied seatbelt is installed in Audi A3. The seatbelt with pretensioner retractor is a product which decreases the probability and severity of injury of a driver/passenger during a car crash. It is called active seatbelt and starts its function before a crash through tightening the seatbelt (when driver pushes the break) and releasing the webbing using electrical motor in case that crash is avoided. In case of accident the pyrotechnic charge makes the retractor and buckle pretensioner to tighten the seatbelt and eliminate the space between occupant and the seat rapidly (in 0.01 second). This particular seatbelt weighs 1130 grams and it is mainly made of metals (72%) and plastics (27%). The rest are other materials like chemicals, adhesives, lubricants etc.) The assembly of the seatbelt takes place in Autoliv Hungary and it is done partially manually and with the usage of special equipment. The seatbelt consists of 9 main parts: 1. Pretensioner retractor 2. Webbing pin 3. Webbing guide 4. Webbing 5. Pillar loop 6. Tongue overmoulded 7. Stop button cover 8. Stop button loop 9. Sleeve, data carrier This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf Other processes in the CPM Database also included in the above publication: - Seatbelt's car sense ball manufacturing. System Boundaries

Nature Boundary	The performed study is a unit operation. It relates only to the assembly process of 9 subcomponents. Data given by Autoliv in Hungary show that there are emissions to air and water.
Time Boundary	The data were acquired in November 2009, but the energy, water and emissions data come from the year 2008.
Geographical Boundary	The manufacturer is located in Hungary. It was assumed that the energy and water come from the same country.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''

Allocations	The allocation procedure was applicable in case of energy, water and emissions. Those values were given for the annual production. The allocation was done based on the information that half of the resources is used for activities connected with seatbelt production and then allocated according to the operation time.
Systems Expansions	Not applicable

About Inventory

Publication	Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf
Intended User	LCA practitioner
General Purpose	Autoliv has decided to perform 4 LCA projects for the following products: airbag, seatbelt, night vision camera (NVC) and electronic control unit (ECU). The main purpose was to learn more about the products and their environmental performances and eventually decrease their impact on the environment.
Detailed Purpose	The main goals of the study are: 1. Determining the environmental load from seatbelt life cycle focused on 5 impact assessment categories: global warming, acidification, eutrophication, ecotoxicity, human toxicity 2. Comparing the Autoliv performance and performances of its suppliers based on seatbelt

	production 3. Determining which component of seatbelt influences the environment the most 4. Comparison of seatbelt and airbag (also produced by Autoliv) performance 5. Determining whether the transportation has significant contribution on global warming potential

Reviewer	Birgit Brunklaus & Henrikke Baumann -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.
About Data	ESA database project. Year 2010. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: the Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environemental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	In the study it was assumed that the scenario for the end of life is that the seatbelt is shredded together with the car. According to Stena Recycling AB in Sweden, 96-99% of metals like cooper or aluminium and the same amount of iron are recycled in reality. Moreover, 99% of plastics is energy recovered fraction. Based on the above numbers, the seatbelt should be recycled in a high rate: 69.2% - 71.4% will be recycled and 26.4% recovered as energy. This particular seatbelt was chosen because it was important to have pyrotechnics in it and that it should be representative for more than one model. The studied seatbelt was the object of the LCA study for Autoliv. More processes from the same study were also documented in this database. In parallel to the seatbelt, 3 other LCA studies for Autoliv were carried out (for airbag, night vision camera and electronic control unit). Some of the processes can be found also in the CPM database.

System Boundaries

Nature Boundary	The performed study is gate-to-gate. It starts with controlling the materials and ends with packing. Data given by bobbin manufacturer show air emissions but also waste water is produced.
Time Boundary	The data were acquired in October 2009, but the electricity data, other resource and emission data come from the year 2008.
Geographical Boundary	The manufacturer is located in China.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	The data were given for the production of this particular part. It was divided by the number of items.
Systems Expansions	Not applicable

Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Seatbelt's car sense ball manufacturing. Autoliv ESA-DBP
Functional Unit	1 car sense ball
Functional Unit Explanation	1 ball weighs 1.65 grams. In one seatbelt twelve of the balls are placed. The total weight of seatbelt is 1129.865 grams.
Process Type	Gate to gate
Site	Unknown
Sector	Manufacturing
Owner	Unknown

Technical system description	The balls are internal components of the seatbelt. In each studied seatbelt there are 12 balls which are situated in the tube. They are the carriers of the force created by pyrotechnic explosion which is then transfered to the pinion, spindle and webbing in order to tighten the seatbelt just after a crash. They are made of aluminium alloy and each of them weighs 1.65 grams. They are produced in 2 manufacturing plants: in Fulda, Germany and Bouficha, Tunisia and then delivered to Autoliv Hungary. The suppliers of the materials for the second manufacturer (located in Tunisia) are located in US and France and transported by ship. The manufacturing process consists of few steps as followed: 1. Pressing 2. Flashing while defects are removed 3. Polishing 4. Visual inspection 5. Packing This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. SPINE LCI dataset: Seatbelt's frame production. Autoliv ESA-DBP

Administrative	
Finished	Y
Date Completed	2010-07-08
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System

Name	Seatbelt's frame production. Autoliv ESA-DBP
Functional Unit	1 seatbelt frame
Functional Unit Explanation	1 frame weighs 169.5 grams and it is one of the nine main parts in seatbelt which weighs 1129 grams
Process Type	Gate to gate
Site	Autoliv Stakupress. Norderstedt, Germany.
Sector	Manufacturing
Owner	Autoliv Stakupress. Norderstedt, Germany.
Technical system description	The frame has constructing and housing functions for the pretensioner retractor. The main parts of pretensioner retractor are fastened to it. It is made of steel and it is coated against corrosion. Its weight is 169.5 grams. This kind of frame can be used in many different objects and devices where there is a need for kind of base or framework for the other parts. The product is manufactured in Autoliv Stakupress in Germany. The suppliers of the materials are located in Germany as well. The following steps are included in data set: 1. Fine blanking 2. Vibrator grinding soft 3. Bending 4. Heat treatment (hardening) 5. Vibrator grinding hard 6. Electroplating with Zn 7. Applying passivation layer Zn/ZnNi 8. Annealing The process starts with fine blanking of steel and then grinding. The next step is bending and the result at this stage is a metal blank. The material is then heated and grinded again. After this step the product is electroplated with Zn what consists of defined sequence of galvanic steps without rinsing. Then the passivation layer is applied which is followed by annealing. This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Technical System	
Name	Seatbelt's gas generator assembly. Autoliv ESA-DBP
Functional Unit	1 gas generator
Functional Unit Explanation	1 gas generator weighs 11.25 grams and it is a part of seatbelt which weighs 1129.865 grams
Process Type	Unit operation
Site	Autoliv NCS Proto. Survilliers, France.
Sector	Manufacturing
Owner	Autoliv NCS Proto. Survilliers, France.
Technical system description	In the gas generator all the processes responsible for the seatbelt deployment take place. When there is a signal for deployment, the initiator, which is placed in the generator, generates the charge which makes the gas generator release gases in order to tighten the belt and eliminate the space between the seat and the occupant rapidly (on 0.01 second). When the gas generator explodes, released gas pushes the mass boddies (chain of balls) throught the tube what moves the pinion and spindle. As a result, the belt is tightened. The gas generator is assembled in Autoliv France and then transported and installed into the sealtbelt's short tube in Autoliv Hungary. It weighs 11.25 grams. The assembly is done partially manually and with the usage of special equipment. It consists of following parts: 1. Holder 2. Shunt ring 3. Sealant, omnifit 4. O-ring 5. Initiator serviceable 6. Cap 7. Propellants 8. Bar code This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Reviewer	Birgit Brunklaus & Henrikke Baumann -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.
About Data	ESA database project. Year 2010. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: the Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environemental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	In the study it was assumed that the scenario for the end of life is that the seatbelt is shredded together with the car. According to Stena Recycling AB in Sweden, 96-99% of metals like cooper or aluminium and the same amount of iron are recycled in reality. Moreover, 99% of plastics is energy recovered fraction. Based on the above numbers, the metal parts of gas generator should be recycled in a high rate of 96-99%. Plastic parts will be recovered as energy. The seatbelt will be deployed before shredding, so the explosive materials but also oxidizers will be released as the gases during this process. The studied product is a part of the seatbelt which was the object of the LCA study for Autoliv. More processes from the same study were also documented in this database. In parallel to the seatbelt, 3 other LCA studies for Autoliv were carried out (for airbag, night vision camera and electronic control unit). Some of the processes can be found also in the CPM database.

Technical System	
Name	Seatbelt's header manufacturing. Autoliv ESA-DBP
Functional Unit	1 header
Functional Unit Explanation	1 header weighs 1.9174 grams and it is a part of seatbelt which weighs 1129.865 grams.
Process Type	Gate to gate
Site	Unknown
Sector	Manufacturing
Owner	Unknown
Technical system description	The header is a part of seatbelt produced by Autoliv. It is placed in a pretensioner retractor and it is mainly made of steel, ceramic and NiFe alloy. The product weighs 1.92 gram. The manufacturing plant is located in Lan Skroun, Czech Republic and the ready product is then transported to Autoliv in France. The manufacturing process starts with casting and then the cast is coated and plated with respectively gold and nickel. This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf Other processes in the CPM Database also included in the above publication: - Seatbelt's car sense ball manufacturing. Autoliv ESA-DBP - Seatbelt's bobbin manufacturing. Autoliv ESA-DBP

	- Seatbelt's frame production. Autoliv ESA-DBP - Seatbelt's gas generator assembly. Autoliv ESA-DBP - Seatbelt's polyamide granules production. Autoliv ESA-DBP - Seatbelt's initiator serviceable assembly. Autoliv ESA-DBP - Seatbelt's label bam manufacturing. Autoliv ESA-DBP - Seatbelt's pillar loop production. Autoliv ESA-DBP - Seatbelt's pretensioner retractor assembly. Autoliv ESA-DBP - Seatbelt's rivet nut manufacturing. Autoliv ESA-DBP - Seatbelt assembly. Autoliv ESA-DBP - Seatbelt's short tube assembly. Autoliv ESA-DBP - Seatbelt's solder paste manufacturing. Autoliv ESA-DBP - Seatbelt's spindle assembly. Autoliv ESA-DBP - Seatbelt's spring antiretour manufacturing. Autoliv ESA-DBP - Seatbelt's spring, wire manufacturing. Autoliv ESA-DBP - Seatbelt's synchronization ball manufacturing. Autoliv ESA-DBP - Seatbelt's tongue production. Autoliv ESA-DBP - Seatbelt's tube manufacturing. Autoliv ESA-DBP - Seatbelt's web sensor manufacturing. Autoliv ESA-DBP - Seatbelt's webbing manufacturing. Autoliv ESA-DBP

System Boundaries

Nature Boundary	The performed study is gate-to-gate. It starts with shaping the product and ends with coating and plating. Data given by header manufacturer show that there is no emissions to environment.
Time Boundary	The data were acquired in September 2009, but the electricity data and sale data come from the year 2008.
Geographical Boundary	The manufacturer is located in Czech Republic.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	Allocation procedure for electricity and water was done based on value of total sale and value of single product. The rest of data were given per 1 product.
Systems Expansions	Not applicable

About Inventory

Publication	Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf

Intended User	LCA practitioner
General Purpose	Autoliv has decided to perform 4 LCA projects for the following products: airbag, seatbelt, night vision camera (NVC) and electronic control unit (ECU). The main purpose was to learn more about the products and their environmental performances and eventually decrease their impact on the environment.
Detailed Purpose	The discussed header is the part of the seatbelt which was the object of the study. The main goals of the study are: 1. Determining the environmental load from seatbelt life cycle focused on 5 impact assessment categories: global warming, acidification, eutrophication, ecotoxicity, human toxicity 2. Comparing the Autoliv performance and performances of its suppliers based on seatbelt production 3. Determining which component of seatbelt influences the environment the most 4. Comparison of seatbelt and airbag (also produced by Autoliv) performance 5. Determining whether the transportation has significant contribution on global warming potential
Commissioner	Autoliv Development AB - .
Practitioner	Arief Mujiyanto & Susetyo Priyojati - .
Reviewer	Birgit Brunklaus & Henrikke Baumann -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Year 2010. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: the Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environemental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	In the study it was assumed that the scenario for the end of life is that the seatbelt is shredded together with the car. According to Stena Recycling AB in Sweden, 96-99% of metals like cooper or aluminium and the same amount of iron are recycled in reality. Moreover, 99% of plastics is energy recovered fraction. Based on the above numbers, the header should be recycled in a high rate. The studied product is a part of the seatbelt which was the object of the LCA study for Autoliv. More processes from the same study were also documented in this database. In parallel to the seatbelt, 3 other LCA studies for Autoliv were carried out (for airbag, night vision camera and electronic control unit). Some of the processes can be found also in the CPM database.

SPINE LCI dataset: Seatbelt's initiator, serviceable assembly. Autoliv ESA-DBP

Technical System	
Name	Seatbelt's initiator, serviceable assembly. Autoliv ESA-DBP
Functional Unit	1 initiator serviceable
Functional Unit Explanation	1 initiator serviceable weighs 4.1248 grams and it is a part of seatbelt which weighs 1129.865 grams
Process Type	Unit operation
Site	Autoliv NCS Proto. Survilliers, France.
Sector	Manufacturing
Owner	Autoliv NCS Proto. Survilliers, France.
Technical system description	The initiator is a part of the seatbelt and it is responsible for generating the charge which makes a gas generator to be activated. In case of accident the pyrotechnic charge makes the retractor and buckle pretensioner tighten the seatbelt and eliminates the space between the seat and the occupant rapidly (in 0.01 second). Initiator is assembled in Autoliv in France and then installed in gas generator in the same plant. It weighs 4.12 grams.

	The assembly is done partially manually and with the usage of special equipment. It consists of the following components: 1. Initiator overmolding 2. Header 3. PCB 4. Solder paste lead free 5. Solder paste alfafree 6. Paste 7. Powder 8. Loaded cup 9. O-ring 10. Cover This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf Other processes in the CPM Database also included in the above publication: - Seatbelt's car sense ball manufacturing. Technical System

Name	Seatbelt's label bam manufacturing. Autoliv ESA-DBP
Functional Unit	1 label bam
Functional Unit Explanation	1 label bam weighs 0.22 gram and it is a part of the seatbelt which weighs 1129.865 grams.
Process Type	Gate to gate
Site	Unknown
Sector	Manufacturing
Owner	Unknown
Technical system description	This particular label bam is a data carrier which is put on the seatbelt installed in Audi A3. It is made of polyester and paper and weighs 0.22 gram. It is manufactured in the plant in Oberschleißheim, Germany and then put on the seatbelt during its assembling. The manufacturing process consists of following steps: 1. Preparing the material 2. Die cutting 3. Printing on pressure sensitive material The result of the manufacturing process are labels on roll. This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. SPINE LCI dataset: Seatbelt’s pillar loop production. Autoliv ESA-DBP

Administrative	
Finished	Y
Date Completed	2010-07-08
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Seatbelt’s pillar loop production. Autoliv ESA-DBP
Functional Unit	1 pillar loop
Functional Unit Explanation	1 pillar loop weighs 79 grams and it is one of the nine main parts in the seatbelt which weighs 1129 grams
Process Type	Gate to gate
Site	Autoliv Stakupress. Norderstedt, Germany.
Sector	Manufacturing
Owner	Autoliv Stakupress. Norderstedt, Germany.
Technical system description	The pillar loop is a part of the seatbelt and has the anchor function for seatbelt. The studied seatbelt is 3 points type and one of these points is created by pillar loop. The webbing passes through it when the belt is adjusted. The product is manufactured in Autoliv Stakupress in Germany and then it is transported to Autoliv Hungary. It consists of steel which is coated against corrosion and the plastics which is overmoulded. The following steps are included in data set: 1. Stamping 2. Vibrator grinding 3. Heat treatment 4. Vibrator grinding II 5. Zinc flakes coating 6. Top coat 7. Overmoulding The process starts with oil stamping and grinding of raw material (steel C60). The steel is then heated and grinded again. After this step the part is coated with zinc flakes and in the end overmoulded with plastics (polyoximethylene). This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv’s front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. System Boundaries

Nature Boundary	The performed study is gate-to-gate. It starts with processing the materials from the suppliers and ends with completing the pillar loop. Data given by the pillar loop manufacturer show only water emissions but they all are treated.
Time Boundary	The data were acquired in January 2010, but the electricity data and sale data come from the year 2008.
Geographical Boundary	The manufacturer and its suppliers are located in Germany. It was assumed that the raw materials come from the same country.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintanance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	The allocation procedure was applicable in case of electricity, oil, gas and emissions. Those values were given for the annual production. Allocation was based on the value of annual production and value of studied product. The rest of the factors (materials) were given per product so the allocation was not needed.
Systems Expansions	Not applicable

About Inventory	
Publication	Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf
Intended User	LCA practitioner
General Purpose	Autoliv has decided to perform four LCA projects for the following products: airbag, seatbelt, night vision camera (NVC) and electronic control unit (ECU). The main purpose was to learn more about the products and their environmental performances and eventually decrease their impact on the environment.
Detailed Purpose	The discussed pillar loop is a part of the seatbelt which was the object of the study. The main goals of the study are: 1. Determining the environmental load from seatbelt life cycle focused on 5 impact assessment categories: global warming, acidification, eutrophication, ecotoxicity, human toxicity 2. Comparing the Autoliv performance and performances of its suppliers based on seatbelt production 3. Determining which component of the seatbelt influences the environment the most 4. Comparison of seatbelt and airbag (also produced by Autoliv) performance 5. Determining whether the transportation has significant contribution on global warming potential
Commissioner	Autoliv Development AB - .

Applicability	For applicabilty for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Year 2010. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: the Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environemental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	In the study it was assumed that the scenario for the end of life is that the seatbelt is shredded together with the car. According to Stena Recycling AB in Sweden, 96-99% of metals like cooper or aluminium and the same amount of iron are recycled in reality. Moreover, 99% of plastics is energy recovered fraction. Based on the above numbers, the pillar loop should be recovered in a high rate of 96-99%. The studied product is a part of the seatbelt which was the object of the LCA study for Autoliv. More processes from the same study were also documented in this database. In parallel to the seatbelt, 3 other LCA studies for Autoliv were carried out (for airbag, night vision camera and electronic control unit). Some of the processes can be found also in the CPM database.

SPINE LCI dataset: Seatbelt's polyamide granules production. Autoliv ESA-DBP

Technical System	
Name	Seatbelt's polyamide granules production. Autoliv ESA-DBP
Functional Unit	1kg of granules
Functional Unit Explanation	For the studied seatbelt 0.418 grams of granules is needed.
Process Type	Unit operation
Site	Unknown
Sector	Manufacturing

Owner	Unknown
Technical system description	Polyamide granules are the part of initiator overmolding which is located in the seatbelt. They consist of polyamide 66 and glass fibre. Granules are manufactured in the plant which is located in Plaisir, France. The granules are manufactured through extrusion process and then transported to Autoliv plant in France. This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf Other processes in the CPM Database also included in the above publication: - Seatbelt's car sense ball manufacturing. Autoliv ESA-DBP - Seatbelt's bobbin manufacturing. Autoliv ESA-DBP - Seatbelt's frame production. Autoliv ESA-DBP - Seatbelt's gas generator assembly. Autoliv ESA-DBP - Seatbelt's header manufacturing. Autoliv ESA-DBP - Seatbelt's initiator serviceable assembly. Autoliv ESA-DBP - Seatbelt's label bam manufacturing. Autoliv ESA-DBP - Seatbelt's pillar loop production. Autoliv ESA-DBP - Seatbelt's pretensioner retractor assembly. Autoliv ESA-DBP - Seatbelt's rivet nut manufacturing. Autoliv ESA-DBP - Seatbelt assembly. Autoliv ESA-DBP - Seatbelt's short tube assembly. Autoliv ESA-DBP - Seatbelt's solder paste manufacturing. Autoliv ESA-DBP - Seatbelt's spindle assembly. Autoliv ESA-DBP - Seatbelt's spring antiretour manufacturing. Autoliv ESA-DBP - Seatbelt's spring, wire manufacturing. Autoliv ESA-DBP - Seatbelt's synchronization ball manufacturing. Autoliv ESA-DBP - Seatbelt's tongue production. Autoliv ESA-DBP - Seatbelt's tube manufacturing. Autoliv ESA-DBP - Seatbelt's web sensor manufacturing. Autoliv ESA-DBP - Seatbelt's webbing manufacturing. Autoliv ESA-DBP

System Boundaries

Nature Boundary	The performed study is a unit operation. It consists of thermoplastic extrusion. Data given by granules manufacturer show only waste which are then landfilled or reused and recycled.
Time Boundary	The data were acquired in November 2009, but the resources and waste data come from the year 2008.
Geographical Boundary	The manufacturing plant is located in Plaisir, France.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included''
Allocations	The data given by the supplier were expressed in values per kg, so the allocation procedure was not needed.
Systems Expansions	Not applicable

SPINE LCI dataset: Seatbelt's pretensioner retractor assembly. Autoliv ESA-DBP

Administrative	
Finished	Y
Date Completed	2010-07-08
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Seatbelt's pretensioner retractor assembly. Autoliv ESA-DBP
Functional Unit	1 pretensioner retractor
Functional Unit Explanation	1 pretensioner retractor weighs 759.292 grams and it is a part of the seatbelt which weighs 1129.865 grams
Process Type	Unit operation
Site	Autoliv ALH. Sopronkövesd, Hungary.
Sector	Manufacturing

Owner	Autoliv ALH. Sopronkövesd, Hungary.
Technical system description	Pretensioner retractor is a part of a seatbelt that is responsible for tightening the belt and eliminating the slack between the occupant and seat just after a crash. The retraction is initiated by the signal from the car sensors after a crash occurs. Then the initiator creates the charge which makes gas generator explode. The emitted gas pushes the mass boddies (chain of the balls) which cause the movement of the pinion and connected with it spindle. Spindle is directly attached to the webbing so the result of this process is that the belt is tightened. The assembly of the pretensioner retractor takes place in Autoliv Hungary and it is done partially manually and with the usage of special equipment. The pretensioner retractor consists of 15 main parts: 1. Frame 2. Collector 3. Guide ball 4. Rivet blindniet 5. Tube 6. Cover 1 7. Cover 2 8. Rivet nut 9. Spindle 10. Web sensor 11. Bearing plate 12. Car sensor 13. Ball for car sensor 14. Cap 15. Identification label 16. Label This process is included in the system described in: Iwanek K., Samiee N. (2010). System Boundaries

Nature Boundary	The performed study is a unit operation. It relates only to the assembly process of 16 subcomponents. Data given by Autoliv in Hungary show that there are emissions to air and water.
Time Boundary	The data were acquired in November 2009, but the energy, water and emissions data come from the year 2008.
Geographical Boundary	The manufacturer is located in Hungary. It was assumed that the energy and water come from the same country.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	The allocation procedure was applicable in case of energy, water and emissions. Those values were given for the annual production. The allocation was done based on the information that half of the resources is used for activities connected with seatbelt production and then allocated according to the operation time.
Systems Expansions	Not applicable

SPINE LCI dataset: Seatbelt's short tube assembly. Autoliv ESA-DBP

Administrative	
Finished	Y
Date Completed	2010-07-08
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Seatbelt's short tube assembly. Autoliv ESA-DBP
Functional Unit	1 short tube
Functional Unit Explanation	1 short tube weighs 136.7791 grams and it is a part of seatbelt which weighs 1129.865 grams
Process Type	Unit operation
Site	Autoliv ALH. Sopronkövesd, Hungary.
Sector	Manufacturing
Owner	Autoliv ALH. Sopronkövesd, Hungary.
Technical system description	The short tube is a crucial part of the studied seatbelt. It is placed in pretensioner retractor and all the processes connected with pyrotechnics take place there. In case of accident the pyrotechnic charge makes the pretensioner retractor tighten the seatbelt and eliminate the space between occupant and the seat rapidly (on 0.01 second). The tube is ended with gas generator. When there is a signal from the sensors in the car, the initiator in gas generator creates the charge to make gas generator explode. The gas is released under the high pressure and pushes the mass bodies (chain of balls) through the tube. That moves the pinion and spindle which is attached to the webbing. The assembly of the short tube takes place in Autoliv Hungary and it is done partially manually and with the usage of special equipment. It consists of 9 main parts: 1. Ball synchronization 2. Snap-in-faster 3. Identification label 4. Tube 5. Compression spring 6. Ball, car sense x 12 7. Piston 8. Antiretour spring 9. Gas generator

	This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. System Boundaries

Nature Boundary	The performed study is a unit operation. It relates to assembly process of 9 components. Data given by short tube manufacturer show air and water emissions.
Time Boundary	The data were acquired in November 2009, but the energy, water and emissions data come from the year 2008.
Geographical Boundary	The manufacturer is located in Hungary. It was assumed that the energy and water come from the same country.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	The allocation procedure was applicable in case of energy, water and emissions. Those values were given for the annual production. The allocation was done based on the information that half of the resources is used for activities connected with seatbelt production and then allocated according to the operation time.
Systems Expansions	Not applicable

Flow Data

General Activity QMetaData

Date Conceived	2009
Data Type	Derived, unspecified
Represents	See 'Function'
Method	Data gathered from manufacturer using data collection sheet.
Literature Reference	Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://www.cpm.chalmers.se/CPMDatabase/DataReferences/ESA_2010--4.pdf
Notes	For the studied seatbelt 2 rivet nuts are needed. During the process electricity for washing is used. However the supplier have given specific data for it.

About Inventory	
Publication	Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf
Intended User	LCA practitioner
General Purpose	Autoliv has decided to perform 4 LCA projects for the following products: airbag, seatbelt, night vision camera (NVC) and electronic control unit (ECU). The main purpose was to learn more about the products and their environmental performances and eventually decrease their impact on the environment.
Detailed Purpose	The discussed short tube is the part of the seatbelt which was the object of the study. The main goals of the study are: 1. Determining the environmental load from seatbelt life cycle focused on 5 impact assessment categories: global warming, acidification, eutrophication, ecotoxicity, human toxicity 2. Comparing the Autoliv performance and performances of its suppliers based on seatbelt production 3. Determining which component of seatbelt influences the environment the most 4. Comparison of seatbelt and airbag (also produced by Autoliv) performance 5. Determining whether the transportation has significant contribution on global warming potential
Commissioner	Autoliv Development AB - .
Practitioner	Katarzyna Iwanek & Nima Samiee - .
Reviewer	Birgit Brunklaus & Henrikke Baumann -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Year 2010. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: the Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environemental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	In the study it was assumed that the scenario for the end of life is that the seatbelt is shredded together with the car. According to Stena Recycling AB in Sweden, 96-99% of metals like cooper or aluminium and the same amount of iron are recycled in reality. Moreover, 99% of plastics is energy recovered fraction. Based on the above numbers, the short tube should be recovered in a high rate. The studied product is a part of the seatbelt which was the object of the LCA study for Autoliv. More processes from the same study were also documented in this database. In parallel to the seatbelt, 3 other LCA studies for Autoliv were carried out (for airbag, night vision camera and electronic control unit). Some of the processes can be found also in the CPM database.

SPINE LCI dataset: Seatbelt's solder paste manufacturing. Autoliv ESA-DBP

Technical System

Name	Seatbelt's solder paste manufacturing. Autoliv ESA-DBP
Functional Unit	1kg of paste
Functional Unit Explanation	For 1 analyzed seatbelt the paste is needed in amount of 0.12 grams. The seatbelt weighs 1129.865 grams.
Process Type	Gate to gate
Site	Unknown
Sector	Manufacturing
Owner	Unknown
Technical system description	Solder paste is used for manufacturing the gas generator which is the important part in the particular seatbelt produced by Autoliv. It is used for fastening some small components. In the analyzed paste, the alloy consists of Sn, Pb and Ag. The paste is manufactured in the plants which are located in Cholet, France and St Priest, France and then is transported to Autoliv in France. The manufacturing process consists of following steps: 1. Atomisation of metal 2. Sieving 3. Blending with flux 4. Filling the syringe This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf Other processes in the CPM Database also included in the above publication: - Seatbelt's car sense ball manufacturing. Autoliv ESA-DBP - Seatbelt's bobbin manufacturing. Autoliv ESA-DBP - Seatbelt's frame production. Autoliv ESA-DBP - Seatbelt's gas generator assembly. Autoliv ESA-DBP - Seatbelt's webbing manufacturing. Autoliv ESA-DBP

System Boundaries

Nature Boundary	The performed study is gate-to-gate. It starts with atomising the metals and ends with filling in the syringe. Data given by one of the manufacturers show that there are air emissions and also toxic solid waste is produced.
Time Boundary	The data were acquired in January 2010, but the data come from 2008.
Geographical Boundary	The supplier no. 1 of which the data are used is located in Cholet, France and the other one is in St Priest, France.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	The data about the content were given per product. The rest of the data was given for the whole production and then the number of items and its weight were given as well.
Systems Expansions	Not applicable

SPINE LCI dataset: Seatbelt's spindle assembly. Autoliv ESA-DBP

Administrative	
Finished	Y
Date Completed	2010-07-08
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Seatbelt's spindle assembly. Autoliv ESA-DBP
Functional Unit	1 spindle
Functional Unit Explanation	1 spindle weighs 230 grams and it is a part of the seatbelt which weighs 1129.865 grams.
Process Type	Unit operation
Site	Autoliv ALH. Sopronkövesd, Hungary.
Sector	Manufacturing
Owner	Autoliv ALH. Sopronkövesd, Hungary.
Technical system description	The spindle is a part of the studied seatbelt and it is located in a pretensioner retractor. It is a part of the mechanism which adjusts the tension of the belt. When a crash occurs, gas generator emits a gas under the high pressure which pushes mass bodies (chain of balls) through the tube and causes the move of the pinion which is connected with the spindle. The result is that the belt is retracted and the space between the occupant and the seat is eliminated what decreases the probability and severity of the injury. The spindle is assembled in Autoliv Hungary and then fastened into pretensioner retractor and seatbelt in the end. The weight of this product is 230 grams. The assembly of the spindle is done partially manually and with the usage of special equipment. It consists of: 1. Safety plate 2. Spring wire 3. Gear wheel 4. Tread head 5. Bar torsion 6. Bobbin mirror 7. Gear ring 8. Bar code This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. About Data	ESA database project. Year 2010. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: the Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environemental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	In the study it was assumed that the scenario for the end of life is that the seatbelt is shredded together with the car. According to Stena Recycling AB in Sweden, 96-99% of metals like cooper or aluminium and the same amount of iron are recycled in reality. Moreover, 99% of plastics is energy recovered fraction. Based on the above numbers, the spring antiretour should be recovered in a high rate. The studied product is a part of the seatbelt which was the object of the LCA study for Autoliv. More processes from the same study were also documented in this database. In parallel to the seatbelt, 3 other LCA studies for Autoliv were carried out (for airbag, night vision camera and electronic control unit). Some of the processes can be found also in the CPM database.

SPINE LCI dataset: Seatbelt's spring, wire manufacturing. Autoliv ESA-DBP

Technical System	
Name	Seatbelt's spring, wire manufacturing. Autoliv ESA-DBP
Functional Unit	1 spring, wire
Functional Unit Explanation	1 spring wire weighs 0.21 gram and it is a part of seatbelt which weighs 1129.865 grams.
Process Type	Gate to gate
Site	Unknown
Sector	Manufacturing
Owner	Unknown
Technical system description	This particular spring wire is used in pretensioner retractor in seatbelt. It is produced in 2 manufacturing plants. First is located in Beuren, Germany and the other one in Lichtenstein, Germany. The spring wire is made of stainless steel and it weighs 0.21 gram. The manufacturing process consists of the following steps: 1. Receipt of material

	2. Manufacturing 3. Cleaning 4. Heat treatment 5. Packing/dispatch This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF:http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf Other processes in the CPM Database also included in the above publication: - Seatbelt's car sense ball manufacturing. Autoliv ESA-DBP - Seatbelt's bobbin manufacturing. Autoliv ESA-DBP - Seatbelt's frame production. Autoliv ESA-DBP - Seatbelt's gas generator assembly. System Boundaries

Nature Boundary	The performed study is gate-to-gate. It starts with shaping the material and ends with dispatching. Data given by spring wire manufacturers do not show any emissions. Only scrap is produced.
Time Boundary	The data were acquired in December 2009, but the data come from the year 2008.
Geographical Boundary	The manufacturers are located in Germany.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	Data were given per 1 product.
Systems Expansions	Not applicable

Intended User	LCA practitioner

General Purpose	Autoliv has decided to perform 4 LCA projects for the following products: airbag, seatbelt, night vision camera (NVC) and electronic control unit (ECU). The main purpose was to learn more about the products and their environmental performances and eventually decrease their impact on the environment.
Detailed Purpose	The discussed wire spring is the part of the seatbelt which was the object of the study. The main goals of the study are: 1. Determining the environmental load from seatbelt life cycle focused on 5 impact assessment categories: global warming, acidification, eutrophication, ecotoxicity, human toxicity 2. Comparing the Autoliv performance and performances of its suppliers based on seatbelt production 3. Determining which component of seatbelt influences the environment the most 4. Comparison of seatbelt and airbag (also produced by Autoliv) performance 5. Determining whether the transportation has significant contribution on global warming potential

SPINE LCI dataset: Seatbelt's tongue production. Autoliv ESA-DBP

Administrative	
Finished	Y
Date Completed	2010-07-08
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Seatbelt's tongue production. Autoliv ESA-DBP
Functional Unit	1 tongue
Functional Unit Explanation	1 tongue weighs 52,493 grams and it is one of the nine main parts in seatbelt which weighs 1129.865 grams
Process Type	Gate to gate
Site	Autoliv Stakupress. Norderstedt, Germany.
Sector	Manufacturing
Owner	Autoliv Stakupress. Norderstedt, Germany.
Technical system description	The tongue is a part of the seatbelt which is responsible for locking the seatbelt into the buckle. It is made of coated steel and it is overmoulded with plastics. It represents the average tongue used for seatbelts. The product is manufactured in Autoliv Stakupress in Germany. The following steps are included in data set:

1. Fine blanking
2. Vibrator grinding soft
3. Bending
3. Heat treatment (hardening)
4. Vibrator grinding hard
5. Electroplating Cu Ni Cr
6. Annealing
7. Overmoulding

The process starts with fine blanking of steel and then grinding. The next step is a bending and the result at this stage is a metal blank. The material is then heated and grinded again. After this step the product is electroplated with Cu, Ni and Cr what consists of 11 galvanic steps without rinsing. In the end the product is overmoulded with plastics (polyoximethylene).

This process is included in the system described in:
Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden.

Date Completed	2010-07-08
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Seatbelt's tube manufacturing. Autoliv ESA-DBP
Functional Unit	1 tube
Functional Unit Explanation	1 tube weighs 97.5 grams and it is a part of seatbelt which weighs 1129.865 grams
Process Type	Gate to gate
Site	Unknown
Sector	Manufacturing
Owner	Unknown
Technical system description	The tube is a part of the seatbelt. It is placed in the pretensioner retractor. It is used for assembly the 'short tube' which is ended with gas generator. In the tube massbodies (balls) are located which are a part of the mechanism for tighting the seatbelt after a crash. It is ended with gas generator and when a crash occurs, gas pushes the balls which activate the mechanism of tightening the seatbelt. The tube is manufactured in Linz, Austria and then transported to Autoliv Hungary. The main input for this process is a raw tube which is made of steel and weighs 97.5 grams. The steps connected with tube manufacturing are as followed: 1. Delivery and inspection of the materials (raw tube) 2. Raw tube purification with HCl 3. Drawing process 4. Heat treatment I (annealing at 900 degrees) 5. Drawing process with flexible inner tool 6. Heat treatment II 7. Finishing and oiling 8. Bending 9. Stamping 10. Expanding 11. Verifying 12. Packing and inspection This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. About Inventory

Publication	Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--4.pdf
Intended User	LCA practicioner
General Purpose	Autoliv has decided to perform 4 LCA projects for the following products: airbag, seatbelt, night vision camera (NVC) and electronic control unit (ECU). The main purpose was to learn more about the products and their environmental performances and eventually decrease their impact on the environment
Detailed Purpose	The discussed tube is the part of the seatbelt which was the object of the study. The main goals of the study are: 1. Determining the environmental load from seatbelt life cycle focused on 5 impact assessment categories: global warming, acidification, eutrophication, ecotoxicity, human toxicity 2. Comparing the Autoliv performance and performances of its suppliers based on seatbelt production 3. Determining which component of seatbelt influences the environment the most 4. Comparison of seatbelt and airbag (also produced by Autoliv) performance 5. Determining whether the transportation has significant contribution on global warming potential.

Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Year 2010. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: the Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environemental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	In the study it was assumed that the scenario for the end of life is that the seatbelt is shredded together with the car. According to Stena Recycling AB in Sweden, 96-99% of metals like cooper or aluminium and the same amount of iron are recycled in reality. Moreover, 99% of plastics is energy recovered fraction. Based on the above numbers, the tube should be recovered in a high rate. The studied product is a part of the seatbelt which was the object of the LCA study for Autoliv. More processes from the same study were also documented in this database. In parallel to the seatbelt, 3 other LCA studies for Autoliv were carried out (for airbag, night vision camera and electronic control unit). Some of the processes can be found also in the CPM database.

Technical System	
Name	Seatbelt's web sensor manufacturing. Autoliv ESA-DBP
Functional Unit	1 web sensor
Functional Unit Explanation	1 web sensor weighs 18 grams
Process Type	Gate to gate
Site	Autoliv ALH. Sopronkövesd, Hungary.
Sector	Manufacturing
Owner	Autoliv ALH. Sopronkövesd, Hungary.
Technical system description	The web sensor is a part of the seatbelt and it is located in the pretensioner retractor. It is made of 4 main components: ratchet wheel (plastics), lever (plastics), spring (stainless steel) and mass (coated alloy). It weighs 18 grams. The web sensor is produced in Autoliv Hungary and then is assembled into the pretensioner retractor and in the end to the seatbelt. The assembly of the web sensor is done partially manually and with the usage of special equipment. This process is included in the system described in: Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. System Boundaries

Nature Boundary	The performed study is gate-to-gate. It relates to the manufacturing of web sensor. Data given by web sensor manufacturer show air and water emissions.
Time Boundary	The data were acquired in November 2009, but the they come from the year 2008.
Geographical Boundary	The manufacturer is located in Hungary.
Other Boundaries	Excerpt from the report, see 'Literature reference': ''Maintenance of production capital as well as personnel related environmental impacts were excluded from the study. Transportation within the production plant was not included.''
Allocations	The allocation procedure was applicable in case of energy, water and emissions. Those values were given for the annual production. The allocation was done based on the information that half of the resources is used for activities connected with seatbelt production and then allocated according to the operation time.
Systems Expansions	Not applicable

Technical System	
Name	Seatbelt's webbing manufacturing. Autoliv ESA-DBP
Functional Unit	1 meter of webbing
Functional Unit Explanation	1 meter of webbing weighs 57.8 grams. For the studied seatbelt 3.77 meters is used. The seatbelt weighs 1129.865 grams.
Process Type	Gate to gate
Site	Unknown
Sector	Manufacturing
Owner	Unknown
Technical system description	Webbing is a most visible part of the seatbelt. It is basically the 'belt' that everybody can see. It is a part which has a direct contact with the occupant on the seat and is connected with the buckle with the usage of the tongue and the tension of it is adjusted by the pretensioner retractor. It is made of yarn and for 1 seatbelt 3.77 meters of webbing is needed. The webbing is produced in the plant which is located in Ieper, Belgium. The manufacturing process consists of following steps: 1. Weaving 2. Dyeing 3. Inspection 4. Cutting the webbing for seatbelts

This process is included in the system described in:
Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden.

SPINE LCI dataset: Si wafer production and Si wafer processing for integrated circuits

Administrative	
Finished	Y
Date Completed	2000-03-03
Copyright	Ericsson
Availability	Official

Technical System	
Name	Si wafer production and Si wafer processing for integrated circuits
Functional Unit	1 mm2 silicon wafer surface.
Functional Unit Explanation	The motivation for choosing this functional unit is: · suitable unit to work with in an LCA of a private branch exchange (a complicated telecom product) · important component of the MD110 product system and many other electronic products. One chip from the manufactured silicon wafer is a sub-part of the SOP14 capsule. No design specifications exist for silicon wafers. A product specification for the SOP14 capsule can be found in the activity Integrated circuit capsule assembly.

Process Type	Gate to gate
Site	Not relevant
Sector	Manufacturing
Owner	Not relevant
Technical system description	This activity includes the production of a silicon wafer used for integrated circuits, and describes the chain from quartz to silicon wafer. The activity is based on information acquired from three manufacturers. The description of the process is supplied by manufacturer one, but is assumed to be general for this type of manufacture. The following process steps are included; -- Silicon processing and wafer production-- First the quartz sand has has to be transformed to metallic grade silicon (MG Si) and then the metallic grade silicon is transfered to electronic grade silicon (EG Si). The last step is EG Si transformation to Si wafer. Typical steps Si wafer production: Reduction of SiO2 ---> Si ----> Si wafer -- Silicon wafer processing -- Typical steps Si wafer processing: 1. Applying photoresist 2. Litography 3. Etching 4. Deposition of metal or other layers 5. Stripping of photresistlayers In the so called mask steps the above steps are repeated.

System Boundaries

Nature Boundary	The emissions to air and water have nature as recipient. Each parameter mentioned by the component manufacturers has been studied. No parameter has deliberately been disregarded when environmental impacts have been studied. Included component manufacturers have not specified the same parameters. In the cases where only one manufacturer has stated a parameter this has been used.
Time Boundary	1997 The answer from the manufacturer arrived in 1998 and they measured in 1997. The process technology used is most certainly the best available as the factories are located in the Netherlands, Sweden and Malaysia and the companies are well established.
Geographical Boundary	The technical system for this model is limited to the factory where the production takes place. The manufacturers included in the average are located in the Netherlands, Sweden and Malaysia.
Other Boundaries	Delimitations to the system is the making of the Silicon wafer.The production of the subparts (e.g. ceramic, caps, leads and targets) of the resistor is not included in this model The transportation of them to the factory is not included.
Allocations	The manufacturers have not described how the allocation has been made. We did not decide or have any suggestions on how the manufacturer should allocate in their factory.
Systems Expansions	None.

Flow Data

General Activity QMetaData

Date Conceived	1998
Data Type	Derived, unspecified
Represents	See 'Function'
Method	The data that are presented are calculated as a average based on information from three component manufacturers. The information from the manufacturers was acquired using a LCI data questionnaire. The average for each presented flow is calculated as follows: - First the amount of each flow per functional unit is calculated for each component manufacturer - Then the calculated amount for each component manufacturer is summed for each unique flow and divided by the number of included component manufacturers In the information supplied by the manufacturer, they had indicated whether the data for each flow were measured, estimated or calculated. Below is a detailed account of the calculation procedure. Definition of variables: CMn: Component manufacturer number n. Myn: Materials, emission, waste, energy (y) given in component answer n. ACyn: Amount of material y in component, expressed in mg (or similar) by component manufacturer n Wn: Weight of one piece of component, expressed in mg (or similar) by component manufacturer n. Nyn: The flow y expressed per functional unit from manufacturer n. Step 1. For CM1 sum AC1+..+.ACn Step 2: The sum AC11+..+.ACyn = W1 Step 3: Divide all flows between M11...M1n by W1 --> N11...N1n Step 4: Repeat Step 1 to 3 for all component manufacturers and for each flow. Step 5: Sum N1n+..Nyn and divide by the number of terms for each unique flow.(material input, emission etc.) An average calculation like above of up to three answers was made.

About Inventory

Publication	Not available. -- Data documented by: Anders Andrae, Ericsson Business Networks AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The intended use for this LCI
General Purpose	The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks. The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system. The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB. Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts. The main purpose of the study for Ericsson is; - to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and - to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the internal work with an Environmental Management System for Ericsson Enterprise Systems. Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson. The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.
Detailed Purpose	Map a silicon wafer process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the silicon wafer (for IC) production in our telecom products. The usage for this set of data are life cycle assessments where integrated circuit chips of silicon are part of the studied system. Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX. The division into component groups is based on structural resemblance, electrical function and material contents of the different components. -- Below is a list of the component groups and corresponding models that have been compiled: 1. Cables - Model: Cable assembly 2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly 3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly 4. Connectors and holders - Model: Connector assembly

	5. Diodes - Model: Diode wafer production and assembly 6. Display units and indicators - Model: Liquid crystal display assembly 7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked) 8. Other - Model: ''Other'' electronic component assembly 9. Potentiometers - Model: Potentiometer assembly 10. Printed boards - Model: Printed board assembly 11. Relays - Model: Relay assembly 12. Resistor networks - Model: Resistor network assembly 13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly 14. Resistors; surface mounted devices - Model: Resistor for surface mounting assembly 15. Transformers and inductors - Model: Inductor assembly 16. Transistors and opto couplers (2 models) - Models: 1. Transistor assembly and 2. Si wafer production and Si wafer processing for transistors (these models are interlinked)

Applicability	This set of data can be applied to silicon wafers used for integrated circuits (i.e. IC´s) in electronic equipment if you the total chip area of the chips in the IC´s. The model shall be regarded as one of two connected models describing three main steps in the manufacturing of a integrated circuit.
About Data	The data is based on information from one Dutch, one Swedish and one Malaysian manufacturer. For component manufacturer one and two (CM1 and CM2) the information was gathered using the manufactures own brochures and investigations respectively. The information from CM3 was gathered using a life cycle inventory questionnaire. All flows are not average values and where there were only one manufacturer stating a certain flow, this one was chosen in the model. Of the flows about little less than 74 % are not average values. The flows for Energy inputs of Coal and Electricity, Raw material inputs of Acids, Ar(g), Gases, H2, HCl, Inorganics + salts, Kraftliner, LDPE, Organics, Oxygen, SiO2 and Water, Emissions to air of Acetone, Ar(g) and CO2, Emission to water of water, Waste output of Acetone are average values. In specific QMetaData for each flow, we have indicated specifically for each flow how many manufacturers have been included. The outline of the LCI data questionnaire that were used in the inventory follows below. No limitations or specifications were set for which substances they had to account -- LCI data questionnaire -- Transport description: Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km). We here only asked for flows exceeded 2% by weight of the material declaration of the component. Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes.´ Process description. Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gatherd it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (e.g. planned changes in production rate) Material, components and natural resource input, etc. We told them to express data in amount per functional unit. Name of material, component or resource. Used amount(mg). Amount In Product(mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production site (address). Suppliers of transport (address). Additional information.

	Emissions. Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information. Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information. Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information. Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.

Technical System	
Name	Si wafer production and Si wafer processing for transistors
Functional Unit	1 mm2 transistor wafer (Si) surface.
Functional Unit Explanation	The motivation for choosing this functional unit is: · Suitable unit to work with in an LCA of a private branch exchange (a complicated telecom product) · Important component of the MD110 product system and many other electronic products. One chip from the manufactured silicon wafer is a sub-part of the SOT23 capsule. No design specifications exist for silicon wafers. A product specification for the SOT23 capsule can be found in the activity Transistor assembly.
Process Type	Gate to gate
Site	Not relevant
Sector	Manufacturing
Owner	Not relevant
Technical system description	This activity includes the production of a silicon wafer used for transistors, and describes the chain from quartz to silicon wafer. The activity is based on information acquired from one manufacturer. The description of the process is supplied by manufacturer one, but is assumed to be general for this type of manufacture. The following process steps are included; -- Silicon processing and wafer production-- First the quartz sand has to be transformed to metallic grade silicon (MG Si) and then the metallic grade silicon is transferred to electronic grade silicon (EG Si). The last step is EG Si transformation to Si wafer. Typical steps in Si wafer production: Reduction of SiO2 ---> Si ----> Si wafer -- Silicon wafer processing -- Typical steps Si wafer processing: 1. Applying photoresist 2. Lithography 3. Etching 4. Deposition of metal or other layers 5. Stripping of photoresistlayers

	In the so called mask steps the above steps are repeated.

System Boundaries	
Nature Boundary	The emissions to air and water have nature as recipient. Each parameter mentioned by the component manufacturer has been studied. No parameter has deliberately been disregarded when environmental impacts have been studied. Included component manufacturers have not specified the same parameters. In the cases where only one manufacturer has stated a parameter this has been used.
Time Boundary	1997 The answer from the manufacturer arrived in 1998 and they measured in 1997. The process technology used is most certainly the best available as the factory the company are well established. The location of the factory is the Netherlands.
Geographical Boundary	The technical system for this model is limited to the factory where the production takes place. The location is the Netherlands. It is not specified if the silicon manufacturing and the silicon processing take place in the same factory.
Other Boundaries	Delimitations to the system are the Si wafer production and Si wafer processing steps in the making of the transistor. The production of the ancillary materials (e.g. salts, organics and gases) needed is not included in this model. The transportation of them to the factory is not included.
Allocations	The manufacturer has partly described how the allocation has been made. The following details were given by the manufacturer: Description of allocations of energy flows: - Auxiliary buildings/processes Product development, pilot assembly, quality testing and measurement, some technical facilities have been allocated to incoming wafer area. - Epitaxy have been allocated to processed wafer area. - Some technical facilities have been allocated to electricity use of wafer fab. - Wafer sawing and cleaning of vacuum devices have been allocated to equal division over waferfabs. - Canteen have been allocated to employees of wafer fab. We did not decide or have any suggestions on how the manufacturer should allocate in their factory. The energy flows have been allocated with help from the facility department.
Systems Expansions	None.

Flow Data	
General Activity QMetaData	
Date Conceived	1998
Data Type	Derived, unspecified
Represents	See 'Function'
Method	We asked three manufacturers for a transistor with capsule size SOT23. This model only describe the Si wafer production and Si wafer processing, and not the assembly/encapsulation to the semiconductor (SOT23) device. The model shall be regarded as one of two connected models describing three main steps in the manufacturing of a transistor. We got one usable answer, here referred to as CM, and the data that are presented are based on information this component manufacturer. The information was requested using a LCI data questionnaire. However, the manufacturer instead sent a brochure containing the requested information. The data presented here are based on this brochure.
Literature Reference	Iwanek K., Samiee N. (2010). Life Cycle Assessment of Autoliv's front seatbelt. Master thesis report. ESA report 2010:4, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://www.cpm.chalmers.se/CPMDatabase/DataReferences/ESA_2010--4.pdf
Notes	The suppliers of materials for this product are located in Germany so it was assumed that the origin of these materials is the same.

About Inventory

Publication	Not available -- Data documented by: Anders Andrae, Ericsson Business Networks AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The intended use for this LCI
General Purpose	The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks. The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system. The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB. Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts. The main purpose of the study for Ericsson is; - to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and - to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the internal work with an Environmental Management System for Ericsson Enterprise Systems. Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson. The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.
Detailed Purpose	Map a transistor chip process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the silicon manufacturing and silicon processing of transistor chips and resembling components in our telecom products. The usage for this set of data are life cycle assessments where transistors are part of the studied system. Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX. This particular model is used in connection with a transistor assembly model describing the final assembly of transistors. The division into component groups is based on structural resemblance, electrical function and material contents of the different components. -- Below is a list of the component groups and corresponding models that have been compiled: 1. Cables - Model: Cable assembly 2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly 3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly 4. Connectors and holders - Model: Connector assembly 5. Diodes - Model: Diode wafer production and assembly 6. Display units and indicators - Model: Liquid crystal display assembly 7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked) 8. Other - Model: ''Other'' electronic component assembly 9. Potentiometers - Model: Potentiometer assembly 10. Printed boards - Model: Printed board assembly 11. Relays - Model: Relay assembly 12. Resistor networks - Model: Resistor network assembly

	13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly 14. Resistors; surface mounted devices - Model: Resistor for surface mounting assembly 15. Transformers and inductors - Model: Inductor assembly 16. Transistors and opto couplers (2 models) - Models: 1. Transistor assembly and 2. Si wafer production and Si wafer processing for transistors (these models are interlinked)

Applicability	This set of data can be applied to silicon wafers used as chip in transistors in electronic equipment if you know the surface area of the silicon chips in the transistors. The model shall be regarded as one of two connected models describing three main steps in the manufacturing of a transistor.
About Data	The data is based on information from one Dutch manufacturer. The information was requested using a life cycle inventory questionnaire. The manufacturer chose to instead give us an owned made brochure with LCI data for their production. The data in the brochure answered our questions. Here is a quotation from the brochure: ''The data for inputs and outputs are real measured data, whereas the outputs of emissions to air and water and of waste are estimates, based on expert views.'' The outline of the LCI data questionnaire that was used in the inventory follows below. No limitations or specifications were set for which substances they had to account. -- LCI data questionnaire -- Transport description: Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km). We here only asked for flows exceeded 2% by weight of the material declaration of the component. Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes. Process description. Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gathered it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (e.g. planned changes in production rate) Material, components and natural resource input, etc. We told them to express data in amount per functional unit. Name of material, component or resource. Used amount(mg). Amount In Product(mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production site (address). Suppliers of transport (address). Additional information. Emissions. Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information. Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information. Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information. Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.

Technical System	
Name	Silviculture of softwood AGGR
Functional Unit	1 m3 softwood at roadside
Functional Unit Explanation	
Process Type	Cradle to gate
Site	Sweden
Sector	Forestry
Owner	Sweden
Technical system description	The system describes the cultivation cycle for softwood delivered at road side in Sweden. The following subsystems are included: tree plant nursing, soil preparation, planting softwood plants, clearing of young forest, fertilising in silviculture, thinning of forest area, final felling and forwarding of harvested wood. See the flowchart to see how they are linked. See also the documentation of each of these included subsystems for a further description.

Method	We asked three manufacturers for a transistor with capsule size SOT23. This model only describe the Si wafer production and Si wafer processing, and not the assembly/encapsulation to the semiconductor (SOT23) device. The model shall be regarded as one of two connected models describing three main steps in the manufacturing of a transistor. We got one usable answer, here referred to as CM, and the data that are presented are based on information this component manufacturer. The information was requested using a LCI data questionnaire. However, the manufacturer instead sent a brochure containing the requested information. The data presented here are based on this brochure.

Practitioner	Alexandersson, Anders - MariTerm Göteborg.
Reviewer	
Applicability	The data was compiled to represent the energy use and emissions of average engines installed in Swedish vessels. The energy use and emissions for different engines may however vary. The data should therefore not be used as a basis to calculate the energy use and emissions of engines installed in international vessels. The emissions of particles and NOx are influenced by the fuel quality, depending on the nitrogen and sulphur content in the fuel. The development of engines has aimed to increase the efficiency of the engine, i.e. decrease the bunker consumption preserving the power outtake. This has resulted in an increase of the specific emissions of NOx, while the emissions of other parameters has decreased.
About Data	The data is compiled using data from engine manufacturers.
Notes	The data was used as a basis to calculate the energy use and emissions for different vessels in the work of NGM published in Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997

Applicability	The data was compiled to represent the energy use and emissions of average engines installed in Swedish vessels. The energy use and emissions for different engines may however vary. The data should therefore not be used as a basis to calculate the energy use and emissions of engines installed in international vessels. The emissions of particles and NOx are influenced by the fuel quality, depending on the nitrogen and sulphur content in the fuel. The development of engines has aimed to increase the efficiency of the engine, i.e. decrease the bunker consumption preserving the power outtake. This has resulted in an increase of the specific emissions of NOx, while the emissions of other parameters has decreased.
About Data	The data is compiled using data from engine manufacturers.
Notes	The data was used as a basis to calculate the energy use and emissions for different vessels in the work of NGM published in Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997

SPINE LCI dataset: Smelt iron in a ladle

Administrative	
Finished	Y
Date Completed	02-12-31
Copyright	
Availability	Public

Technical System	
Name	Smelt iron in a ladle
Functional Unit	6,59 kg smelt iron
Functional Unit Explanation	6,59 kg smelt iron is used to produce one bearing housing, SNL 511-609, at SKF Mekan AB in Katrineholm. The data in this activity is taken from the LCA of the bearing housing SNL 511-609, and thus it was more convenient to keep this functional unit. The figure 6,59 has nothing to do with guide rings as such.
Process Type	Unit operation
Site	SKF Mekan ABBox 89 641 21 Katrineholm
Sector	Materials and components
Owner	SKF Mekan ABBox 89 641 21 Katrineholm
Technical system description	This activity describes a process step included in the system ''Production of guide rings used for spherical roller bearings'', also available in the SPINE@CPM database. The guide ring is manufactured at SKF Mekan AB in Katrineholm and the process consists of several steps. See the activity ''Production of guide rings used for spherical roller bearings'' for details. The guide ring will finally be mounted into the SKF Spherical Roller Bearing 232/530. The function of the guide ring is to assure that the rollers stay in the raceways of the bearing. After the smelting process, the smelt is transported in a ladle to the furnace to keep it heated. The ladle is preheated through combustion of LPG before use. This activity only describes the pre heating in the ladle and thus the consumption of LPG. The production and combustion of LPG is NOT included in this dataset and should be taken into account in order to obtain the total environmental impact. Data is taken from an earlier LCA study of the bearing housing SNL 511-609: Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmars University; August 2002.

System Boundaries	
Nature Boundary	No emissions to air or to water are known.
Time Boundary	The data was collected during the autumn 2002 and no changes in the procedure are planned for the nearest future.
Geographical Boundary	The process takes place at SKF Mekan AB in Katrineholm, Sweden
Other Boundaries	The production and combustion of LPG is NOT included in this study and must be taken into account in order to obtain the total environmental impact.
Allocations	Allocations were made according to weight
Systems Expansions	Not Applicable

SPINE LCI dataset: Smelting of iron, type V10

Administrative	
Finished	Y
Date Completed	02-12-31
Copyright	
Availability	Public

Technical System	
Name	Smelting of iron, type V10
Functional Unit	6,59 kg smelt iron
Functional Unit Explanation	6,59 kg smelt iron is used to produce one bearing housing, SNL 511-609, at SKF Mekan AB in Katrineholm. The dataset is used unchanged for our specific case (production of guide rings), and thus the functional unit is 6,59 kg smelt. The figure 6,59 has nothing to do with guide rings as such. The smelt iron will finally become a guide ring used in a spherical roller bearing 232/530.
Process Type	Unit operation
Site	SKF Mekan ABBox 89 641 21 Katrineholm
Sector	Materials and components
Owner	SKF Mekan ABBox 89 641 21 Katrineholm
Technical system description	This activity describes a process step included in the system ''Production of guide rings used for spherical roller bearings'', also available in the SPINE@CPM database. Smelting of iron, type V10, is the first process step when producing a guide ring used for the SKF Spherical Roller Bearing 232/530. The function of a guide ring is to assure that the rollers stay in the raceways of the bearing. The raw material is assembled at a storage place outside the plant. It is collected by a traverse and led to the smelting process. The raw material and the alloying substances are divided into the right proportions according to a specific prescription and are then smelted in the electric furnaces. The prescription in this specific case is called V10 and consists of: Pig iron: 3% Steel scrap: 25% Recycled iron: 58% (from their own processes) Steel scrap 14% (from cage manufacturing at SKF Göteborg) Alloying substances are added to give the material the optimal chemical composition. These substances are : Carbomax PK M 1,30% FeMn 0,10% FeS 0,02% Cu 0,07% SiC 1,10% For the smelting process data from bearing housing was used. Data is taken from an earlier LCA study of the bearing housing SNL 511-609: Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmars University; August 2002. , but the ingoing components were changed according to the prescription, type V10, which is used specific for guide rings.

System Boundaries

Nature Boundary	Recycled iron and steel scrap are not considered resources and are not followed from the cradle, but comes from the technosphere. Many of the chemicals used in the process are not followed from the cradle, since it was too time consuming and the impact was assumed to be very small since the total amount and the substances according to product data sheets not were considered hazardous. These inflows are considered non-elementary and come from the technosphere. Emissions to air and water are included.
Time Boundary	The data was collected during the autumn 2002 and no changes in the procedure are planned for the nearest future.
Geographical Boundary	The smelting process takes place at SKF Mekan in Katrineholm, Sweden.
Other Boundaries	Production of Electricity (14 MJ) and District heat (90,1kJ) are NOT included in the data set and should be considered as Swedish average production and followed from the cradle in order to obtain the complete environmental impact. The production of pig iron should be traced from the cradle with the activity ''Production of pig iron'' available in SPINE@CPM database.
Allocations	Allocations have been made according to weight.
Systems Expansions	N/A

Practitioner	Helene Berg - .
Reviewer	Olle Ramnäs -
Applicability	The data is valid for smelting of iron (and steelscrap) at SKF Mekan AB, Katrineholm. Care needs to be taken for ingoing components, since there are many different prescriptions for cast iron, and the data in this specific case is for the type V10.
About Data	Data is gathered from interviews with Marja Andersson, SKF Mekan AB, Katrineholm. The data for the calculations is obtained from an earlier LCA study of the bearing housing SNL 511-609: Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmars University; August 2002. Only the ingoing components and alloying substances were changed according to the prescription, type V10, which is used specific for guide rings. For bearing housing another type of iron is smelted: type L10.
Notes	

SPINE LCI dataset: Soil preparation

Administrative	
Finished	Y
Date Completed	1994-02-24
Copyright	None
Availability	Public

Technical System	
Name	Soil preparation
Functional Unit	ha
Functional Unit Explanation	Per hectare of prepared soil to be used for forestry
Process Type	Gate to gate

Site	Middle Sweden
Sector	Forestry
Owner	Middle Sweden
Technical system description	After a clear-cutting of the ground, the soil has to be prepared in order to be planted upon. This is done by mechanically (tractors or specially designed vehicles) removing the topmost layer down to the mineral soil in patches or strips. The planting can also be made on top of the tilted layer.

System Boundaries

Nature Boundary	Emissions caused by diesel combustion is not included in the system.
Time Boundary	An increased use of more efficient machinery would decrease the use of fuels.
Geographical Boundary	Central Sweden
Other Boundaries	N/A
Allocations	N/A
Systems Expansions	N/A

About Inventory

Publication	None -- Data documented by: Göran Swan, Ola Svending, STORA Corporate Research Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	LCA practitioners.
General Purpose	The purpose is to supply with LCA-data for forestry to be used in further studies of wood products.
Detailed Purpose	These data are an update of earlier data on the same subject.
Commissioner	- Stora Corporate Research, Box 601 661 29 Säffle Sweden.
Practitioner	Swan, Göran - Stora Corporate Research, Box 601, S-661 29 Säffle, Sweden.
Reviewer	
Applicability	These data are valid for large scale soil preparation whitin forestry. It is important to check the type of fuel used. In this case, fossil fuel is assumed to be used. Other data is available from other forest companies, or from Skogforsk, or STFI.

	The silviculture process in Sweden has eight steps: 1. Plant nursing 2. Soil preparation 3. Planting 4. Clearing 5. Thinning 6. Fertilizing 7. Final felling 8. Forwarding This is the second step.
About Data	An increased use of more efficient machinery would decrease the use of fuels.
Notes	N/A

SPINE LCI dataset: Solid waste management AGGR

Flow Chart
This data set transparently reported, including a flowchart where each process is individually described

Technical System	
Name	Solid waste management AGGR
Functional Unit	.
Functional Unit Explanation	
Process Type	Gate to grave
Site	Europe
Sector	Waste management
Owner	Europe
Technical system description	This solid waste management system is based on municipal waste: household and commercial waste. A basic sorting activity, which sorts different parts of the waste, is included as well as different treatments. Treatment activities included are: 1. Thermal treatment - Incineration 2. Biological treatment - Composting and Biogasification 3. Landfilling (Material recycling is not included) See the flowchart to see how they are linked. See also the documentation of each of these included subsystems for a further description. Volatile organic compounds included are alcohols, ketones, terpenes, esters, organic sulphides, aldehydes and ethers. Total organic compound for composting and biogasification is 588.5 g/tonne composted biowaste and 3.017 g/tonne of biowaste for biogasifiction. [De Baere, Anaerobic Digestion of Solid Waste: State of Art.Proc. Second International Symposium on Anaerobic Digestion of Solid Waste, Barcelona, 15-18 June, 1999] The partitioning or amount of waste to different treatment plants can differ significantly from region to region. Therefore it is important to know that this aggregated system, Solid waste management, have partitoning based on figures from Renova, Sweden: 12% Biological treatment 13% Recycling 10% Landfilling 65% Incineration [Avfallsmängder till Renovas anläggningar under 2000, www.renova.se]

Method: Emissions of dioxins from the subsystem Thermal treatment of solid municipal waste.	Output	Emission	Dioxin	9.42E-03			kg	Air	
Method: Emissions of esters are from the subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	Esters	751			kg	Air	
Method: Emissions of ethers are from the subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	Ethers	37.4			kg	Air	
Method: Emission of HCl from the subsytem Thermal treatment of solid municipal waste.	Output	Emission	HCl	29.6			tonne	Air	
Method: Emissions of heavy metals come from Thermal treatment of solid municipal waste.	Output	Emission	Hg	47			mg	Air	
Method: Emissions of ketones are from the subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	ketones	2149.8			kg	Air	
Method: Methane is a part of the landfill gas from the subsystem Landfilling of solid municipal waste.	Output	Emission	Methane	1810.56			tonne	Air	
Method: Emission of nitrogen comes from the subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	N total	2.14			kg	Air	
Method: N2 is a part of the landfill gas from the subsystem Landfilling of solid municipal waste.	Output	Emission	N2	118.82			tonne	Air	
Method: Emission of NH3 comes from subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	NH3	3655.1			kg	Air	
Method: Emissions of NH4+ come from the subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	NH4+	1065			kg	Water	
Method: Emissions of heavy metals come from Thermal treatment of solid municipal waste.	Output	Emission	Ni	16.26			mg	Air	
Method: Emissions of NOx come from the subsystem Thermal treatment of solid municipal waste.	Output	Emission	NOx	145.9			tonne	Air	
Method: O2 is a part of the landfill gas from the subsystem Landfilling of solid municipal waste.	Output	Emission	O2	34.04			tonne	Air	
Method: Emission of organic sulphides come from subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	Organic sulphides	135.4			kg	Air	
Method: Particles are emissions from the subsystem Thermal treatment of solid municipal waste.	Output	Emission	Particles	17.13			tonne	Air	
Method: Emissions of heavy metals come from Thermal treatment of solid municipal waste.	Output	Emission	Pb	19.31			mg	Air	
Method: Emission of SO2 comes from the subsystem Thermal treatment of solid municipal waste.	Output	Emission	SO2	62.2			tonne	Air	
Method: Emissions of terpenes come from the subsystems Composting of solid municipal waste and Biogasification of solid municipal waste.	Output	Emission	Terpenes	1205.6			kg	Air	
Method: Emissions of heavy metals come from Thermal treatment of solid municipal waste.	Output	Emission	Zn	712.6			mg	Air	
Method: Compost is a product from the subsystems Composting of municipal solid waste and Biogasification of solid municipal waste.	Output	Product	Compost	12504.5			tonne	Technosphere	
Method: The following subsystems contribute to the output stream of electricity; Thermal treatment of solid municipal waste, Biogasification of solid municipal waste and Landfilling of solid municipal waste. 450 kWh/ton incinerated + 140 kWh/ton biowaste to biogasification + 210 kWh/ton waste to landfill = 67275 MWh +1995 MWh + 4830 MWh = 74100 MWh	Output	Product	Electricity	74100			MWh	Technosphere	
Method: Filter dust is residual waste from the subsystem Thermal treatment of solid municipal waste.	Output	Residue	Filter dust	2990			tonne	Ground	

Method: Residual waste comes from the subsystem Landfilling of solid municipal waste, Biogasification of municipal solid waste, Composting of municipal solid waste and Thermal treatment of municipal solid waste.	Output	Residue	Residual waste	23051.75			tonne	Ground		
Method: Slags and ash are residual waste from the subsystem Thermal treatment of solid municipal waste, see this system for more information.	Output	Residue	Slags and ash	1794			tonne	Ground

SPINE LCI dataset: Solid wood flooring. ESA-DBP

Administrative	
Finished	Y
Date Completed	1994
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public.

Technical System	
Name	Solid wood flooring. ESA-DBP
Functional Unit	1 m2*year flooring
Functional Unit Explanation	Excerpt from the publication (see 'Publication'): ''The purpose of the study was to assess and compare the environmental impact from cradle to grave for floor coverings. The covering of one square metre of flooring during one year of operation was therefore chosen as the functional unit, or basis of comparison.'' 1 m2 of solid wood floor weighs 7.4 kg, including laying waste.
Process Type	Cradle to grave
Site	Not applicable
Sector	Construction
Owner	Not applicable
Technical system description	Excerpt from the publication: ''The life cycle of solid wood flooring. Wood is the only raw material in wood flooring. A production cycle for forestry means that the forest has to be planted, grow, be thinned, be felled, soil-cultivated and re-planted. After cutting, the trees are transported to sawmills, where barking, sawing to the desired dimensions and drying take place. The flooring is then transported to the customer, and laid.'' The flow chart for solid wood flooring can be found at page 249 in the publication. This system is described in: Jönsson et al, 1997, Life cycle assessment of flooring materials: case study. Building and Environment, Vol. 32, No. 3, pp. 245-255.

	Link to pdf: http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf Other processes in the CPM Database also included in the above publication: Linoleum flooring. ESA-DBP Vinyl flooring. ESA-DBP Other processes in the CPM Database connected to the above publication: Dioctyl phthalate (DOP) production. ESA-DBP

System Boundaries

Nature Boundary	Not applicable.
Time Boundary	Data are applicable to the situation at the time, i.e. 1994.
Geographical Boundary	The scenarios describe a Swedish situation. The solid wood studied was produced in Sweden.
Other Boundaries	The solid wood is untreated. Excerpts from the publication (see 'Publication'): - Floorings for domestic use were studied. - It was assumed for the calculations that there is no recycling or recovery of the flooring materials, and that all materials are incinerated, with energy recovery, after use. - It was assumed that all pigments used consisted of titanium dioxide. - Some additives in the products were used in such small quantities that their environmental impact was disregarded in the study.
Allocations	Excerpt from the publication (see 'Publication'): ''The environmental impact of multi-output processes was allocated in proportion to the physical parameter most closely reflecting the economic value, which in most cases resulted in weight being used. No allocation was made between the two functions of incineration, waste elimination and heat production. Instead, the heat produced was reported as a useful energy flow leaving the systems analysed.''
Systems Expansions	Not applicable.

About Inventory	
Publication	Jönsson et al, 1997, Life cycle assessment of flooring materials: case study. Building and Environment, Vol. 32, No. 3, pp. 245-255. Link to pdf: http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf
Intended User	LCA practitioners.
General Purpose	Excerpts from the publication (see 'Publication'): ''THE consequences of the human impact on the environment have become increasingly clear in recent years. A number of previously unknown environmental problems have emerged at local, regional and global levels, in spite of considerable efforts to decrease environmental emissions from identified point sources. Consequently, demands are now being made on the environmental soundness of products. From industry there is a demand for methods of improving products from the environmental point of view, both for internal use and for marketing purposes. Authorities need methods which can be used to assess the environmental consequences of product related decisions. Life cycle assessment (LCA) is becoming an increasingly important method for making product related environmental assessments.'' ''When applying LCA to building materials and components, special methodological problems arise because of the relatively long lifetime and the complex purpose of these products. Therefore, a project entitled ''Environmental Assessment of Buildings and Building Materials'' has been initiated at the Department of Technical Environmental Planning of Chalmers University of Technology (CTH). The case study of flooring materials presented in this article constitutes the first step in this project.''
Detailed Purpose	Excerpt from the publicatoin (see 'Publication'): ''The environmental impact of three flooring materials during their life cycles was assessed and compared using the LCA method. The objective was to make a specific comparison between the environmental impacts of the life cycle of some flooring materials and to develop a methodology for LCA of building materials.''
Commissioner	Not applicable - .
Practitioner	Jönsson, Åsa - Technical Environmental Planning Chalmers University ofTechnology Göteborg Sweden .

Applicability	For applicability for the process see 'Technical System' and 'System Boundaries'.
About Data	Excerpts from the publication (see 'Publication'): '' - The three studied products all have a calorific value and could alternatively be used as fuels. Since the energy recovered from incineration was accounted for as an energy gain, the calorific value of the materials was treated as an energy cost. - Production of electricity was not included in the systems analysed, due to lack of data. Electricity use was thus accounted for only as the amount used. When interpreting the results, the amount of electricity used reflects a number of environmental impacts, including flooded land from hydropower, radioactive waste from nuclear power and emissions to the air from fossil fuel based electricity production. - The environmental impact of cleaning and maintenance was omitted. It was roughly assumed that the cleaning habits are probably independent of what floor covering is used. In addition, no reliable data were available in this area.'' ESA Database Project. Years: 2009-2011. Documentation completed for this data set: 2010-09-15 Administering organisation: Chalmers University of Technology, the division of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA). Review committee for documented data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).

SPINE LCI dataset: Sorting of solid municipal waste

Administrative	
Finished	Y
Date Completed	2002-08-14

Copyright	
Availability	Public

Technical System	
Name	Sorting of solid municipal waste
Functional Unit	230 000 tonne of mixed waste
Functional Unit Explanation	230 000 tonnes of mixed waste containing Municipal solid waste, non-organic material (plastic, glass, metal etc) and organic material. In Sweden one person generates 440 kg household waste/year. A population of 500 000 persons in a urbal area with a generation of 10 000 tonnes of commercial waste/year results in 230 000 tonne of municipal solid waste. Data is based on LCI case studies presented in Integrated Solid Waste Management: a Life Cycle Inventory, F. McDougall, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001.
Process Type	Gate to gate
Site	Europe
Sector	Waste sorting and collection
Owner	Europe
Technical system description	This activity describes a sorting facility. Sorting is an important part of any waste's Life Cycle. Solid waste is almost always mixed, and household wastes are amongst the most heterogeneous in terms of material composition. The earliest sorting will occur in the home then sorting at a Material recovery facility and the sorting of mixed waste to produce refuse-derived fuel are common. Sorting techniques are manual sorting and mechanical sorting. There are three broad categories of mechanical operation: 1. Mechanical disassembly, which separates components physically 2. Separation by particle properties such as size, shape and mass 3. Separation by material property such as magnetism or colour. Common unit processes in mechanical sorting are: Screening, Air classification, Air knife, Sink/float separation, Flotation, Magnetic separation, Electromagnetic separation, Electrostatic separation, Detect and route systems, Roll crushing, Shredding and Baling. Although there is no standard sorting process, an energy consumption of 25 kWh per input tonne is provided in this model as a default value.(McDougall, 2001) Energy consumption depends on which operation and feedstock used. Plant input is often mixed waste, containing Municipal solid waste, non-organic material (plastic, glass, metal etc) and organic material. Mixed waste are passed under a magnet to remove ferrous metals, and then along a conveyor belts where glass bottles, non-ferrous metals and plastic items are hand-picked and recovered. The amount of sorting will depend on the nature of the feedstock, the more narrowly defined the incoming material, the less separation will be required. About Inventory

Publication	Data documented by: Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Documentation reviewed by: Ann-Christin Pålsson, Industrial Environmental Informatics, Chalmers University of Technology Published in SPINE@CPM: 14 August 2002
Intended User	The documentation of this syst
General Purpose	This activity was made to give an indication of sorting of solid waste since data about waste management systems are insufficient and more data are required from the industry.
Detailed Purpose	This acitvity should be used in the aggregated system Solid waste managment to illustrate how sorting of solid waste is performed. The documentation is based on assumption done by the person who made the documentation and data from a Swedish waste management company, Renova. The purpose of the documentation has also been to make data for waste management available in this format for the industry.
Commissioner	
Practitioner	
Reviewer	
Applicability	The amount of sorting needed for specific waste input will depend on the nature of the waste. There are no standard material sorting facility and this activity is aimed to represent an average facility. Also there are no good average values for amount of biowaste, waste to incineration, waste to landfill or waste to material recycling. In this activity, data from Renova in Sweden is used for the different types of waste to different treatments: : 12% Biological treatment 13% Recycling 10% landfilling

	65% Incineration The variations of sorting between different regions and counties in Europe are extensive. To show how amounts of waste to different treatment methods differ some data sets are presented below: Region around Malmö: 5% Composting 38% Recycling 28% landfilling 29% Incineration Vienna, Austria 11% Composting 27% Recycling 31% landfilling 31% Incineration Hampshire, England 6 % Composting 9% Recycling 75% landfilling 10% Incineration
About Data	The descriptions of the activity is how it was understood by the person who made the documentation. Although there are no standard material sorting facility, an energy consumption of 25 kWh/input tonne is provided as an average value, based upon energy consumption data from three different cities in Europe (see QMetaData for further information) No data on emissions were given in the references used.
Notes	For further information about solid waste managment see: Flemström K., Brief overview of solid waste management, IMI-internal report. The report may be downloaded from: http://www.imi.chalmers.se

SPINE LCI dataset: Soy bean cultivation. ESA-DBP

Administrative	
Finished	Y
Date Completed	2005
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Soy bean cultivation. ESA-DBP
Functional Unit	1 ha of soy bean
Functional Unit Explanation	The study was done for Brazilian soy production. (NB: no information about the amount of the soy bean per ha)
Process Type	Cradle to gate
Site	Unknown
Sector	Crop and animal production, hunting etc.
Owner	Unknown
Technical system description	Soy protein is the only plant protein which is 'complete', in the sense that it provides all the essential amino acids needed for human health. It is low in saturated fat and cholesterol-free. It is extracted from the soy bean, which is cultivated in temperate climates. Most of the Swedish and European soy is imported from Brazil in the form of soy meal and the lion's share of it is used in animal fodder. The most common vegetable sausage alternative is the soy sausage, which in Sweden is marketed by several manufacturers. The soy content usually consists of textured soy protein, which in turn consists of 70% protein and 23% dietary fibres. The concentrate is hydrolysed in order to obtain desirable properties. (...) Using the same yield as in the case of pea protein (65%) an amount of 3.6 kg of soy beans is needed to produce 1 kg of textured soy protein. This process is included in the system described in: Abelmann A. (2005). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf

	Other processes in the CPM Database also included in the above publication: - Sausage (Soy-Dog) production. ESA-DBP - Sausage (Pea-Dog) production. ESA-DBP - Sausage (Hot-Dog) production. ESA-DBP - Operation of 'Hot Dogs' producing facility. ESA-DBP - Pea cultivation. ESA-DBP - Production of beef. ESA-DBP - Production of pork. ESA-DBP - Rape seed cultivation. ESA-DBP - Wheat cultivation. ESA-DBP - Sugar beet cultivation. ESA-DBP - Soy bean processing. ESA-DBP

Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The overall aim of the study is to assess the potential environmental impacts of substituting animal protein for regionally grown vegetable protein in food products.''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The objective is to analyze three food products of the same type, and the purpose is to compare the environmental impact of the products and also to identify the most important contributors of the total environmental impact of each product. The products are described as follows. - a product in which all protein is animal protein. - a product in which 10% of the animal protein is replaced with vegetable protein. - a product in which all protein is vegetable protein. Furthermore, the objective is to provide useful information on the products that can be used in other environmental systems analysis, e.g. in meal studies.''

About Inventory

Publication	Abelmann A. (2005). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf
Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The overall aim of the study is to assess the potential environmental impacts of substituting animal protein for regionally grown vegetable protein in food products.''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The objective is to analyze three food products of the same type, and the purpose is to compare the environmental impact of the products and also to identify the most important contributors of the total environmental impact of each product. The products are described as follows. - a product in which all protein is animal protein. - a product in which 10% of the animal protein is replaced with vegetable protein. - a product in which all protein is vegetable protein. Furthermore, the objective is to provide useful information on the products that can be used in other environmental systems analysis, e.g. in meal studies.''

SPINE LCI dataset: Spain, electricity generation mix 1998

Administrative	
Finished	Y
Date Completed	2001-01-31
Copyright	IEA
Availability	Public

Technical System	
Name	Spain, electricity generation mix 1998
Functional Unit	Total electricity produced during 1998
Functional Unit Explanation	The electricity mix refer to the total amount of electricity generated by different power sources expressed in GWh during the year 1998.
Process Type	Unit operation
Site	Spain
Sector	Energyware
Owner	Spain
Technical system description	The generation of electricity with different power generating systems in Spain during the year 1998. Spain includes the Canary Islands.

System Boundaries	
Nature Boundary	Not applicable, since the data only refer to the electricity generation mix. The environmental load for generation of electricity is not included.
Time Boundary	The data refer to 1998.
Geographical Boundary	Only electricity produced in Australia is considered. Import or export of electricity is not included.
Other Boundaries	-
Allocations	Not applicable
Systems Expansions	Not applicable

Flow Data	
General Activity QMetaData	
Date Conceived	1998
Data Type	Derived, statistics
Represents	See 'Function'
Method	The data are collected from IEA Statistics.
Literature Reference	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8, page II.300.
Notes	See ''Represents'' for each flow to see which power generation system that are used to generate the electricity.

About Inventory

Publication	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8. -- Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden --
Intended User	LCA practitioners
General Purpose	The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.
Detailed Purpose	The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.
Commissioner	Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .
Practitioner	Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .
Reviewer	CPM -
Applicability	The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in ''Represents'' in QMetaData for each specific flow. When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations: - Biofuel electricity energy system, EPD-version - Fuel gas electricity energy system, EPD-version - Hydro electricity energy system, EPD-version - Lignite electricity energy system, EPD-version - Nuclear electricity energy system, EPD-version - Oil electricity energy system, EPD-version - Stone coal electricity energy system, EPD-version - Wind electricity energy system, EPD-version The following countries and regions have been documented in the database: Australia, electricity generation mix 1998 Austria, electricity generation mix 1998 Belgium, electricity generation mix 1998 Canada, electricity generation mix 1998 Czech Republic, electricity generation mix 1998 Denmark, electricity generation mix 1998 European Union, electricity generation mix 1998 Finland, electricity generation mix 1998 France, electricity generation mix 1998 Germany, electricity generation mix 1998 Greece, electricity generation mix 1998 Hungary, electricity generation mix 1998 Iceland, electricity generation mix 1998 Ireland, electricity generation mix 1998

	Italy, electricity generation mix 1998 Japan, electricity generation mix 1998 Korea, electricity generation mix 1998 Luxembourg, electricity generation mix 1998 Mexico, electricity generation mix 1998 Netherlands, electricity generation mix 1998 New Zealand, electricity generation mix 1998 Norway, electricity generation mix 1998 OECD Europe, electricity generation mix 1998 OECD North America, electricity generation mix 1998 OECD Pacific, electricity generation mix 1998 OECD total, electricity generation mix 1998 Poland, electricity generation mix 1998 Portugal, electricity generation mix 1998 Spain, electricity generation mix 1998 Sweden, electricity generation mix 1998 Switzerland, electricity generation mix 1998 Turkey, electricity generation mix 1998 United Kingdom, electricity generation mix 1998 United States, electricity generation mix 1998
About Data	
Notes	-- --- Changes made to the data set after publishing in SPINE@CPM--- >>> 22 October 2001: <<< Changes made by Ann-Christin Pålsson, CPM: The electricity production by hard coal, coke oven and blast furnace gas have been corrected from 58866 GWh to 52866 GWh according to the original report. The error was identified and reported by Gunnar Mattson, ABB Corporate Research.

SPINE LCI dataset: Stage performance in a theatre. ESA-DBP

Administrative	
Finished	Y
Date Completed	2010
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Stage performance in a theatre. ESA-DBP
Functional Unit	1 sold ticket
Functional Unit Explanation	Excerpt from the report, see 'Publication': ''With the functional unit of one sold ticket, it is possible to compare the opera with the theatre.''
Process Type	Gate to gate
Site	Regionteater Väst
Sector	Arts and entertainment activities
Owner	Regionteater Väst
Technical system description	The study for a stage performance in a theater was done for Regionteater Väst in Uddevalla. The turnover of the theatre in 2009 was 40 million SEK. Excerpt from the report, see 'Publication': ''The theatre is located in a house close to the harbour in Uddevalla, but there exist also a stage in Borås. The house in Uddevalla has two stages (...). Main business focus in Uddevalla is to present scene plays on these two stages as well as going on tours in the western part of Sweden to different rustic sites (bygdegårdar). The main business focus for the house in Borås is to produce dance plays. The Regionteater Väst does not have any restaurant or catering service. They have around 40 employees if both Uddevalla and Borås are accounted. The play 'Plocka potäter i kostym' was chosen by the theatre employees. The criteria for the play were: - Produced for a tour in the western part of Sweden. - Not produced for children. - Possible to collect data for. Therefore, invoices should be possible to find and the staff should remember the play. There were 24 stage performances in the western part of Sweden. Nine people worked specific with the play 'Plocka potäter i kostym' and ten people had worked indirect with it. For example, the office people and the cleaning personal were not possible to link direct to the play.'' In the study except the stage performance itself there were investigated also other processes connected with it. The following activities were considered: office, painting &

	patination and laundry textile, metal workshop, carpentry, props, costume, wig and make up, building maintanance, employee transport, newspaper and recycling of paper and other waste. This process is included in the system described in: Tengström J., Izurieta F. (2010). LCA of Stage Performances. Life Cycle Assessment of an Opera and a Theatre Stage Performance. ESA Report 2010:8, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--8.pdf Other processes in the CPM Database also included in the above publication: Stage performance in an opera. ESA-DBP

System Boundaries

Nature Boundary	In this study the data relates to the activities that take place in the theatre. It contains resource use, but the resources are not tracked to the cradle. The waste for recycling and incineration are considered as an output.
Time Boundary	Excerpt from the report, see 'Publication': ''The data used are from recent years.''
Geographical Boundary	Excerpt from the report, see 'Publication': ''The stage performances are produced in the Regionteater Väst and in the Gothenburg opera. All the customers are in a range of some km up to the whole Sweden. (...) The environmental impacts are considered on an international basis i.e. not only emissions produced in Sweden are accounted. However, the environmental load during use phase and disposal end up in the Swedish waste handling system that can be affected by the decision from the national authorities.''
Other Boundaries	Excerpt from the report, see 'Publication': ''The building construction is included as LCA average data. (...) Site specific data in this study represents the current situation and does not consider the future technical improvements or decisions to handle different materials.''
Allocations	Excerpt from the report, see 'Publication': ''The amount of stage performance times (24 for the Plocka potäter (...)) is divided by the total amount of stage performances.''
Systems Expansions	Not applicable

Publication	Tengström J., Izurieta F. (2010). LCA of Stage Performances. Life Cycle Assessment of an Opera and a Theatre Stage Performance. ESA Report 2010:8, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--8.pdf
Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The main reason for carrying out this LCA study is to investigate the environmental impact from a stage performance at the Göteborg Opera and the environmental impact from a stage performance at the Regionteater Väst. The specific questions the study answers are: - How large is the environmental impact from a stage performance in the Regionteater Väst? · How large is the environmental impact from a stage performance in the Göteborg Opera? · How can the environmental impact from the stage performances be reduced? · What happen if the consumption of stage performances increases in society? · Is it environmentally better to consume a stage performance compared to a T-shirt?''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The goal of this study is to investigate the environmental performance of stage performances, more specifically an opera and a theatre stage performance, 'Thaïs' respectively 'Plocka potäter i kostym'. Specific questions the study answers are: · Which processes for the play 'Plocka potäter i kostym' in the Regionteater Väst and which processes for the opera 'Thaïs' in the Göteborg Opera contribute most to the environmental impact? The visitors transportation is put to zero in this accounting LCA. Neither the opera, nor the theatre provides the service of transport the visitors back and forth to the play. · What is worst for the environment from a consumer scenario; consume a stage performance in the Regionteater Väst or in the Göteborg Opera? Here is the transportation of the visitors is included. · What is worst for the environment; consume a stage performance in the Regionteater Väst/the Göteborg Opera or a T-shirt? This is important in a wider perspective, because a choice in the society to consume either services or products could be based on scientific research. The reason to choose a T-shirt as the comparative product is the equality in price to a theater or an opera ticket.''

Name	Stage performance in an opera. ESA-DBP
Functional Unit	1 sold ticket
Functional Unit Explanation	Excerpt from the report, see 'Publication': ''With the functional unit of one sold ticket, it is possible to compare the opera with the theatre.''
Process Type	Gate to gate
Site	Göteborg Opera
Sector	Arts and entertainment activities
Owner	Göteborg Opera
Technical system description	The study for a stage performance in an opera was done for Göteborg Opera. The turnover of the opera in 2009 was 400 million SEK. Excerpt from the report, see 'Publication': ''The Göteborg Opera was built in 1994 in the harbor. (...) There are two stages in the house, one big with a bit over 1280 seats and a smaller stage with 230 seats. The opera house also contains a restaurant as well as a café and two bars that serve guests visiting the stage performances. Totally around 450 people are working in the building. (...) The opera chose the play 'Thaïs' suitable to collect data from. The reasons are: -They performance has been performed during year 2009 and year 2010. -The last stage performance was in the spring of year 2010. There were 11 stage performances and around 50 people who were working specific with the play 'Thaïs'. However, more or less the whole opera was indirect working with 'Thaïs'. For example, the office people and the cleaning personal were not possible to link direct to the play. In the study the following activities were included: stage performance, office, marketing, painting workshop, metal workshop, carpentry, scenery, decor, costume, restaurant, wig and make up, building mainatance, employee transport, waste management (paper and burnable waste). This process is included in the system described in: Tengström J., Izurieta F. (2010). LCA of Stage Performances. Life Cycle Assessment of an Opera and a Theatre Stage Performance. About Inventory

Publication	Tengström J., Izurieta F. (2010). LCA of Stage Performances. Life Cycle Assessment of an Opera and a Theatre Stage Performance. ESA Report 2010:8, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2010--8.pdf
Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The main reason for carrying out this LCA study is to investigate the environmental impact from a stage performance at the Göteborg Opera and the environmental impact from a stage performance at the Regionteater Väst. The specific questions the study answers are: - How large is the environmental impact from a stage performance in the Regionteater Väst? · How large is the environmental impact from a stage performance in the Göteborg Opera? · How can the environmental impact from the stage performances be reduced? · What happen if the consumption of stage performances increases in society? · Is it environmentally better to consume a stage performance compared to a T-shirt?''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The goal of this study is to investigate the environmental performance of stage performances, more specifically an opera and a theatre stage performance, 'Thaïs' respectively 'Plocka potäter i kostym'. Specific questions the study answers are:

	· Which processes for the play 'Plocka potäter i kostym' in the Regionteater Väst and which processes for the opera 'Thaïs' in the Göteborg Opera contribute most to the environmental impact? The visitors transportation is put to zero in this accounting LCA. Neither the opera, nor the theatre provides the service of transport the visitors back and forth to the play. · What is worst for the environment from a consumer scenario; consume a stage performance in the Regionteater Väst or in the Göteborg Opera? Here is the transportation of the visitors is included. · What is worst for the environment; consume a stage performance in the Regionteater Väst/the Göteborg Opera or a T-shirt? This is important in a wider perspective, because a choice in the society to consume either services or products could be based on scientific research. The reason to choose a T-shirt as the comparative product is the equality in price to a theater or an opera ticket.''
Commissioner	Region Västra Götaland - .
Practitioner	Francisco Izurieta & Johan Tengström - .
Reviewer	Birgit Brunklaus & Anne-Marie Tillman -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Years 2009-2011. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: The Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	Excerpt from the report, see 'Publication': ''The courtesan 'Thaïs' is standing in the center in Alexandria. Her status as a star is falling. At the same time, the monk Athanaël becomes obsessed to convert her to Christianity. The monk succeeds and 'Thais' leaves her sinful life and starts a new life in a cloister. As time goes by Athanaël realize it is Thais' body he is obsessed with.''

SPINE LCI dataset: Steam cracking in crude oil based LDPE production process. ESA-DBP

Administrative	
Finished	Y
Date Completed	2009
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Steam cracking in crude oil based LDPE production process. ESA-DBP
Functional Unit	1 kg of ethylene
Functional Unit Explanation	1 kg of ethylene is needed to produce 1 kg of LDPE, which was the functional unit for the study.
Process Type	Other
Site	Unknown
Sector	Manufacturing
Owner	Unknown
Technical system description	Steam cracking discussed in this study is one of the steps in crude oil based LDPE (low density polyethylene) production process. This process is gate-to-gate but the electricity and fuel used are traced back to the cradle. In this step naphtha is processed into ethylene. Data for electricity and fuel were calculated for Europe. Excerpt from the report, see 'Publication': ''Steam cracking is the thermal cracking of saturated hydrocarbons into smaller hydrocarbons e.g. ethylene and other olefins, applying steam. In Europe and Asia, the primary raw material for the cracking is naphtha (fraction of the refinery boiling between 35 and 180ºC). For this reason, naphtha is chosen as cracker feed in the study. The cracking process starts with the heating up of the naphtha in a countercurrent flow with flue gases. Then the naphtha is mixed with steam and further heated to 500-680ºC. The temperature depends on its composition. After the heating, the mix flows into a fired tu-bular reactor. It is heated up to 750-875ºC for 0,1-0,5s (while controlling residence time, temperature profile and partial pressure).The naphtha cracks into smaller hydrocarbons mainly ethylene, higher olefins and diolefins.Since this reaction is endothermic, the reaction products have a high temperature. To prevent subsequent reaction they are rapidly

	(0,02-0,1s) cooled down to 550-650ºC, in the so-called quenching step. After the quenching, the products are separated, different separation steps and chem-ical treatments further purify the ethylene.'' This process is included in the system described in: Liptow Ch., Tillman A.-M. (2009). Comparative life cycle assessment of polyethylene based on sugarcane and crude oil. Environmental Systems Analysis, Report 2009:14, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2009--14.pdf Other processes in the CPM Database also included in the above publication: - Ethylene production from cane based ethanol. ESA-DBP - Sugarcane cultivation. ESA-DBP - Refinery in crude oil based LDPE production process. ESA-DBP - Polymerization in crude oil based LDPE production process. ESA-DBP

System Boundaries

Nature Boundary	Excerpt from the report, see 'Publication': ''Outputs accounted for in this study were by-products and emissions released to air. Water emissions were omitted, because of data unavailability for some parts of the sugarcane route.'' The data relate also to the fuel and electricity consumption which were traced back to the cradle.
Time Boundary	Data for steam cracking come from 2008 and they were acquired as the most up-to-date ones. Data used for the fuels come from the year 2004.
Geographical Boundary	Process data are valid for Sweden. For electricity calculations the average data from Europe were applied.
Other Boundaries	Excerpt from the report, see 'Publication': ''Assumption set: - total input treated as naphtha - production mix does not change with input composition - conversion rate does not change with input composition - 'make-up' fuel is natural gas coming from Norway - attributional approach - application of average European electricity supply mix data''
Allocations	Excerpt from the report, see 'Publication': ''allocation between ethylene and other products based on weight; ethylene share = 0,6''
Systems Expansions	Not applicable

About Inventory

Publication	Liptow Ch., Tillman A.-M. (2009). Comparative life cycle assessment of polyethylene based on sugarcane and crude oil. Environmental Systems Analysis, Report 2009:14, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2009--14.pdf
Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The goal of this study is to answer the question, is the use of sugarcane based LDPE in the production of goods and packing in Sweden environmentally preferable to crude oil based LDPE.''
Detailed Purpose	Steam cracking is a step in the production process of LDPE so it was necessary to investigate the environmental load of it.
Commissioner	Unknown - .
Practitioner	Christin Liptow & Anne-Marie Tillman - Environmental Systems Analysis, Chalmers University of Technology.
Reviewer	Tillman, Anne-Marie - Environmental Systems Analysis, Chalmers University of Technology
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Years 2009-2011. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: The Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	Steam cracking is a step in a production process of oil based LDPE which was the object of the study. The production process starts with crude oil extraction and is followed by refining, steam cracking, polymerization, use phase (which was excluded from the study) and inceneration as the end of life. Oil based- was compared in the study to the sugarcane based- LDPE. NB: in the report two approaches were investigated: attributional and consequential. For consequential approach see the report.

SPINE LCI dataset: Steam cracking of refined oil products

Administrative	
Finished	Y
Date Completed	1991
Copyright	
Availability	Public

Technical System	
Name	Steam cracking of refined oil products
Functional Unit	1 kg
Functional Unit Explanation	1 kg ethylene.
Process Type	Gate to gate
Site	Statoil Petrokemi AB Stenungsund
Sector	Materials and components
Owner	Statoil Petrokemi AB Stenungsund
Technical system description	The system consists of steam cracking of refined oil products. The process breaks the oil products down into lighter fractions. In the heating process cracking steam is added to the refined oil products (naphtha and propane among others). The products are ethylene and propylene. By-products are among others burning gas, which is used internally as fuel, cracked gasoline and heavy unsaturated hydrocarbons. The various products are separated after the cracking furnaces by destillation, compressing and cooling. The ethylene is piped to the plastic manufacturer so it can be used in the process directly.

System Boundaries

Nature Boundary	In the system only emissions to air and water are accounted for at the nature boundary.
Time Boundary	
Geographical Boundary	
Other Boundaries	Raw material and the energy consumption are accounted for.
Allocations

About Inventory

Publication	Tillman, A-M., H Baumann, E. Eriksson, and T. Rydberg, ''Life Cycle Analysis of Selected Packing Materials. Quantification of Environmental Loadings'' Offprint from SOU 1991:77. Chalmers Industriteknik, Göteborg, Sweden 1992. -- Data documented by: Maria Erixon and Sara Ågren, project employed at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Henrikke Baumann and Anne-Marie Tillman (responsible for the course material) and Ann-Christin Pålsson (responisble for classification of the dataset), Technical Environmental Planning, Chalmers University of Technology --
Intended User	A Life Cycle Assessment practi
General Purpose	The data set are part of a study of ''Packaging and the Environment''.
Detailed Purpose	Exercise material in LCA coarse given at Teknisk Miljöplanering at Chalmers University of Technology, Sweden.
Commissioner	
Practitioner	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden.
Reviewer	
Applicability	The data are valid for Swedish conditions at a specific plant, but can be used as an approximation to other countries and other plants. One should though be aware of the fact that the situation in other countries may be very different and depending on this one gets an unreliable result. The production at Stenungsund Petrokemi is though quite normal for a refinery in general. The data are based on old sources and should therefore not be regarded as information describing the current situation. The emissions from the production of the electricity used in the system is not accounted for.

Availability	Public

Technical System	
Name	Steel rail production
Functional Unit	kg
Functional Unit Explanation	1 kg steel rail
Process Type	Gate to gate
Site	Sweden
Sector	Materials and components
Owner	Sweden
Technical system description	At Lindab in Förslöv, thin sheet steel products for buildings, like steel studs, drain pipes, gutters, external sills and other sheet metal work are produced from galvanized sheet steel. Some products are painted or otherwise finished, besides the galvanizing process. The energy use at the plant is low, as none of the process steps has a high-energy demand. Electricity is used for the production process and gas for heating of buildings.

About Inventory

Publication	LCA of Builing Frame Structures Environmental Impact over the Life Cycle of Wooden and Concrete frame; Björklund, Tillman; Report 1997:2; TEP; CTH; Göteborg; Sweden --- Data documented by: Maria Erixon, project employed for the database project at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Thomas Björklund, Technical Environmental Planning, Chalmers University of Technology ---
Intended User	To make an LCA of building fra
General Purpose	Among others, to analyse and assess the environmental impact of structural concrete and steel frames in buildings during the whole life-cycle by using the method of LCA as a tool.
Detailed Purpose	To calculate the environmental load of steel rail
Commissioner	- Finncement and Trätek (The Swedish Institute for Wood Technology Research) Box 5609 S-114 86 Stockholm Sweden.
Practitioner	Björklund T., Jönsson Å., Tillman A-M - Technical Environmental Planning, CTH Sven Hultins Gata 8 412 96 Göteborg Sweden .
Reviewer	

Applicability	The environmental load for steel rail production is approximated with the one for steel studs. It is possible through this Database to calculate the environmental load, from cradle to gate, including the sheet steel production. You can find the data for sheet steel production at: Name: Swedish Sheet steel mix Category: Other Publication: LCA of Building Frame Structures Environmental Impact over the Life Cycle of Concrete and Steel frames; Björklund T., Jönsson Å., Tillman A-M.; Report 1996:8; Technical Environmental Planning; Chalmers University of Technology, Göteborg, Sweden
About Data	The environmental load from painting and finishing is excluded, since these process steps are not relevant for the steel studs. Average scrap production amounts to about 3% of the production volume. As the scrap is reused it is regarded as a low-grade product. Emissions to air and water There are no significant process emissions to air and water. In the calculations, emission factors are applied for the fossil fuels.

SPINE LCI dataset: Steeping of gas tanks

Administrative	
Finished	Y
Date Completed	1997-03-01
Copyright	
Availability	Public

Technical System	
Name	Steeping of gas tanks
Functional Unit	ton
Functional Unit Explanation	1 ton steeped tank
Process Type	Gate to gate
Site	AGA-CRYO AB Box 8887 47272 Göteborg
Sector	Materials and components
Owner	AGA-CRYO AB Box 8887 47272 Göteborg
Technical system description	The company steeps stationary and mobile tanks used for liquid gas. The operation consists of steeping and coupling in brass and non-corrosive goods, after soldering with non-cadmium plummet. Also alkaline degreasing with organik solvent is part of the process. The steeping process consist of four steps. 1. The goods are immersed in to a steep bath, with low acid concentration, for 3-4 h. 2. The goods are immersed in to a steep bath, with high acid concentration, one or a couple of times. 3. The goods are rinsed in a tub, with warm water. 4. The goods are flushed with a high-pressure washing appliance. The fourth step is done mostly to clean the unsteeped parts of the goods. Because of the rinsing of the steeped goods the remaining parts of the steep bath are thined down to a negligible concentration. The rinsing and flushing water is continiously pumped through the neutralisation to the slam tub.

System Boundaries	
Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries	
Allocations

About Inventory

Publication	The environmental report from AGA-CRYO AB for 1996, The Environmental Administration in the municipality of Göteborg. -- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg. .
Practitioner	Hoffenback, Rune - AGA-CRYO AB Box 8887 47272 Göteborg .
Reviewer	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg.
Applicability	The company used warm water, which is not specified in the environmental report. The pump used by the company most probably needs some sort of energy to be in operatioon. No energy use is mentioned.

SPINE LCI dataset: Stone coal electricity energy system, EPD-version

Administrative	
Finished	Y
Date Completed	1996-10
Copyright	Bundesamt für Energie, Bern
Availability	Public

Technical System	
Name	Stone coal electricity energy system, EPD-version
Functional Unit	1 TJ net electricity from power plant
Functional Unit Explanation	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
Process Type	Cradle to grave
Site	UCTPE countries Europe
Sector	Grid electricity and district heat
Owner	UCTPE countries Europe
Technical system description	Reported figures are based on data from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, ''Ökoinventare von Energiesystemen'', 3rd edition 1996 and adapted to the demands of the EPD-guidelines (Environmental Product Declaration guidelines in Sweden). -- Brief description -- The main phases inventoried in ETH's life cycle study of electricity generation with stone coal are: mining of coal (open pit and underground), processing I, processing II, transports, storage, power plant operation. Data has been aquired from literature and figures concerning consumption of energyware and materials, use of land and water, emissions to air (also radioactive) and water and wastes have been picked out from or calculated based on literature for all phases of the life cycle. All subsystems are described on a ''cradle-to-grave'' basis, including the main stages, i.e. data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle. -- Detailed description -- Mining and processing I The prospecting of coal implies test drillings etc but is not inventoried separatly since only a few millimeters of drilling per tonne coal is needed. Production of explosives used is included. Radioactive radon, methane and particles are process specific emissions to air and subsoilwater to water. Open pit mining (28% of used stone coal in UCPTE) is used when the coal is found at a depth of a few to 500 meters. The subsoil water level must be lowered below the seam. Mainly diesel driven mobile machines are used. Underground mining (72% of used stone coal in UCPTE) involves the construction of shafts and galleries and the use of mainly electric hoists etc. Typical coal depths are 100-1200 meters. Emitted methane is partly used as fuel. Air condition and cooling plants are included. The average loss of extracted coal in the mechanic processing plant is assumed to be 30% of the weight for open pit mines and 40% of the weight for underground mines. The assumed average energetic loss however is 5% and 8% respectively. The advantages of processing is for example higher heating value, lower sulphur content, less transports and better furnace conditions. All stone coal is supposed to be processed in this study. Construction and operation of mines and processing plants are inventoried. Demolition processes are assumed to be neglectable, transports and deposit areas are however included. Processing II Most of the coal used in power plants in the UCPTE is steam coal coming directly from the first processing plant but in Germany also coke is used (about 18 % of the use in UCPTE). In the cokery coal is degassed in four steps at increasing temperatures. The products are several, coke typically 79% by weight. The cokery is assumed to be supplied with coke gas. Construction phase and area use has been estimated. Transports and storage Transports of stone coal from 6 supply regions have been inventoried regarding distances, vehicles and transshipment. Coal losses and emissions of particles (relatively large) during transport have been estimated. Coal storages are included, their emissions to air and

	leaching water (rough figures). Coal storages emit CO2 due to oxidation of coal, these emission are assumed to happen in the power plant in the ETH calculations. Construction and scrapping of vehicles are included. Power plant Construction and area use has been inventoried for two standard plants (100 and 500 MWe). The smaller standard plant is equiped with electrofilter and wet desulphuring with lime or limestone, the larger plant has a SCR de-NOx device as well. 90% of the UCPTE stone coal power plants are assumed to belong to the 500 MWe class. The plants are medium load power plants with an average of 4000 h of operation per year. Furnace technology is conventional (i.e. no gasifyers or fluid beds). Average efficiencies of power plants have been calculated (35.7%) based on national statistics. Incoming coal to the UCPTE power plants (average heating value 25,1 MJ/kg) is mixed, grinded and dried. Furnace temperatures of 1,300°C giving fly ashes or 1,600°C leading to ash melting are used. Concerning conventional emissions to air national statistics and bottom-up calculations based on existing UCPTE power plants have been used. Emissions of trace elements are estimated and other emissions are calculated based on literature data. Oil-fuelled starting plant is included. Leaching of substances from deposited ashes is included. * Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

System Boundaries

Nature Boundary	Used materials and energyware have been followed from extraction and processing of natural resources. Maufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included). ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH. Vattenfall's criterion in selecting and aggregating ETH's LCI-results for electricity generation in the UCPTE region has been to make the figures usable as general electricity LCI data in EPDs according to Miljöstyrningsrådets guidelines. Especially parameters (emissions) which have established impact indices - accepted by the EPD system - for one or several environmental impact categories, have been picked out and aggregated as far possible. But also metal and energyware resources have been included, as well as waste, in spite of all waste handling processes related to this dataset being included with respect to use of resources and emissions. The latter is an adaption to other LCI data for electricity generation where waste amounts are reported (since those flows have not been followed to the grave). Since ETH claimes that most of the figures regarding metal emissions have an undefined amount of datagaps all metal emissions are aggregated except for a few which are specified separatly since they are reported for most processes in the lifecycle. Metals are reported as elements although they often are part of compounds. Measuring methods often just give the amounts of the different elements found. All hydrocarbons to water are aggregated to one parameter as well as halogenated organics, since no indices exist (that are accepted by the EPD system so far) for characterisation of the individual substances.
Time Boundary	Most background data refer to the period 1990 to 1994. Concerning flue gas cleaning equipment data from 1995/96 has been used where possible. Figures regarding use of materials and mining and processing of coal are older which probably doesn´t affect the result much. Future emissions from deposits for filter ashes are included. The amounts of imported coal to the UCPTE are based on the year 1993. Power plant operation is based on the year 1994. Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPTE* countries between 1990-94 (to level off the large variations in hydro power production over the years). All processes, also those conducted in the past, have been assumed to use average technology of the early nineties. Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows: Equipment in mines 30 years Cokery 30 years Power plant 40 years * Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.
Geographical Boundary	Figures are based on average stone coal power plants in Austria, Belgium, Spain, Italy, Ex-Jugoslavia, France, Netherlands, Portugal, and Germany. The emphasis concerning the inventory of coal mining is the UCPTE but also North and South America, South Africa, Australia&The Far East and Eastern Europe have been regarded since those regions export hard coal to the UCPTE. About 45% of stone coal used in UCPTE power plants is imported from those other regions.

	Processes conducted outside the UCPTE* region are supposed to be supplied with UCPTE* electricity. Data concerning the use of ressources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries. * Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.
Other Boundaries	Data concerning material and energyware use in the construction phase of the mine are rough estimates based on a few real mines. Process specific (i.e. not energyware related) emissions to air from mines have not been included except for radon, methane and particles. The flow of substances in subsoil water is not complete and emissions due to leaching from heaps are rough estimates which probably has an influence on the results. Use and emissions of lubricating and hydraulic oil is not included. Emissions of N2O, dioxines and radioactive substances from cokeries are not included (emissions of other greenhouse gases, hydrocarbons (also aromatic), heavy metals and inorganic substances are included). No accidents were considered in the cokery. Emissions of heavy metals found in emitted particles during transport of coal has not been considered. Emissions of benzene, toluol and xylol from long-time coal storages are not included (emissions of heavy metals and hydrocarbons to water are however included). Accidents are not considered in the power plant. Most data concerning the power plant are based on assumptions and estimates. Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPTE electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH:s LCA for coal power. The ETH study comprises figures concerning use of land, usable content in water storages and amount of turbine water which have not been reported here. The two latter have been excluded due to lack of corresponding data in comparable studies. Use of land has been excluded here because of ETH's advanced approach. Land is divided into two main groups - land and sea - which are subdivided into 4 categories each. Land Criterion Category Natural human impact not larger than other species' since the indutrial revolution I Modified human impact larger than other species', low degree of culivation II Cultivated human impact larger than other species', large degree of cultivation III Built upon dominated by buildings, roads, dams, mines etc. IV Category I is not used in the study. State of land before, during and after exploitation is of intererst. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one. ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. They express use of land in the unit m2year which is diffrent from comparable Swedish studies (m2). See times for restoration of land below: From category IV to category III 5 years From category III to category II 50 years From category II to category I 100 000 years (For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.) ETH specifies about 160 radioactive isotopes emitted to air and water. Radioactive emissions reported here are picked out in accordance with SETAC working group report on data quality and data availability (to be published in 2001). Big accidents occuring seldomly are not included.The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.
Allocations	Allocation in the cokery between the products have been studied according to energy content, weight and price. The results gave an allocation of 76-83% on the coke. In the ETH study 80% has been allocated to coke. The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.

Sometimes plants are grown on the land, but those plants are destroyed.	Output	Residue	Waste in land farming	1.66E+01			kg	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included, as well as emissions from incineration plant.	Output	Residue	Waste to incineration	2.79E+00			kg	Technosphere	

About Inventory

Publication	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at http://www.energieforschung.ch. -- Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden Documentation reviewed by (see also Notes): Rolf Frischknecht, ESU-services, Switzerland Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden --
Intended User	Original study of ETH: LCA pra
General Purpose	The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their life cycles. The results can be used in life cycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans. Vattenfalls purpose - as a commissioner of putting ETH:s data into Spine format with metadata - is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines. Data is supposed to be used together with IEA statistics about electricity generation mixes in the OECD

	countries/regions.
Detailed Purpose	ETH:s aim was to describe the average situation in the UCPTE concerning electricity generation with stone coal. With the help of assumptions and simplifications following phases of the life cycle are described: mining (open pit and underground)), processing, transports, storage and power plant.
Commissioner	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
Practitioner	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villingen/Würenlingen .
Reviewer	None, see further under notes -
Applicability	Data reported here is supposed to be representative for stone coal based electricity generation in the UCPTE countries in 1994. Figures for the cokery included in the study are representative for Germany, European cokeries probably have larger emissions. This set of data is aggregated and documented in accordance with the Swedish EPD-guidelines to be used in combination with IEA statistics concerning electricity generation mixes in OECD countries and regions together with other datasets - based on the ETH study - describing other power generation systems. The EPD-adapted power generation systems in Spine format are named as follows: Fuel gas electricity energy system, EPD-version Biofuel electricity energy system, EPD-version Hydro electricity energy system, EPD-version Lignite electricity energy system, EPD-version Nuclear electricity energy system, EPD-version Stone coal electricity energy system, EPD-version Wind electricity energy system, EPD-version IEA statistics for generation mixes 1998 exist in Spine format for the following 30 countries/regions: OECD total OECD North America OECD Pacific OECD Europe European Union Australia Austria Belgium Canada Czech Rpublic Denmark Finland France Germany Greece Hungary Iceland Ireland Italy Japan Korea Luxembourg Mexico Netherlands New Zealand Norway Poland Portugal Spain Sweden Switzerland Turkey United Kingdom United States
About Data	Most data concerning coal power are based on assumptions and estimates. Emissions of CO2, SO2, NOx, particulates and heat are quite reliable however. Since 45% of coal used in UCPTE power plants is imported and mines in the exporting regions often are supplied with fossil electricity, data does probablynot match with realemissions from electricity generation (underestimation of fossil pollutants, overestimation of radionuclide emissions and nuclear waste generation). Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided). Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16). For references and sources of reported figures see further under Function, Nature boundary, Geographical boundaries, Publication, Notes and General metadata.
Notes	Reviewer of this specification of ETH:s data and metadata has been: Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of aggregation of figures and of Vattenfall's interpretation ot the documentation Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data

	documentation requirements. The technical committee of the Swedish Environmental Management Council - approval of method and aggregation of parameters Project Management of the ETH study, 3rd edition: Professor, Dr. P. Suter and R. Frischknecht, ETH Editorial staff of the 1st edition: R. Frischknecht, P. Hofstetter, I. Knoepfel, M. Ménard, ETH R. Dones, E. Zollinger, Paul Scherrer Institut Authors of the 1st edition: N. Attinger, T. Baumann, G. Doka, R. Dones, R. Frischknecht, H.-P. Gränicher, C. Grasser, P. Hofstetter, I. Knoepfel, M. Ménard, H. Müller, M. Vollmer, E. Walder, E. Zollinger Authors of the revision, 3rd edition: U. Bollens, S, Bosshart, M. Ciot, L. Ciseri, G. Doka, R. Frischknecht, R Hischier, A. Martin, ETH R. Dones, U. Gantner, Paul Scherrer Institut -- --- Changes made to the data set after publishing in SPINE@CPM--- >>> 6 June 2001: <<< Changes made by Ann-Christin Pålsson, CPM based on discussions with Caroline Setterwall, Vattenfall AB. Comments: The following changes has been made in the nomenclature for in- and outflows: Mangane in ore -> changed to: Manganese in ore CH4 -> changed to: Methane (to be in accordance with the nomenclature specified in CPM report 2000:2) CN -> changed to: CN- Stone coal -> changed to: Hard coal (to be in accordance with the nomenclature specified in CPM report 2000:2) Other metals -> changed to: Metals Explanations of nomenclature (inserted in Notes for the specific flows): - CN- is Cyanide ion - Reactive waste deposit is waste at landfill that is still reactive. - Inert waste deposit is waste at landfill that are inert. Additional clarifications: - Note that the flows of waste in the table of in- and outflows are internal flows, i.e. they do NOT cross the system boundaries. All waste handling processes is included in the study with respect to use of resources and emissions. - Radioactive waste is accounted for in cubic metres. The product specific requirements for electricity and district heating generation (PSR 1998:1) in the Swedish EPD system states that waste shall be accounted for in gram. However, no conversion factors were given in the study. There are also no general conversion factors that are commonly used.

SPINE LCI dataset: Stone coal electricity energy system, ETH - full version

Technical System	
Name	Stone coal electricity energy system, ETH - full version
Functional Unit	1 TJ net electricity from power plant
Functional Unit Explanation	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
Process Type	Cradle to grave
Site	UCTPE countries Europe
Sector	Grid electricity and district heat
Owner	UCTPE countries Europe
Technical system description	Reported figures come from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, ''Ökoinventare von Energiesystemen'', 3rd edition 1996. Brief description

The main phases inventoried in ETH's life cycle study of electricity generation with stone coal are: mining of coal (open pit and underground), processing I, processing II, transports, storage, power plant operation.
Data has been aquired from literature and figures concerning consumption of energyware and materials, use of land and water, emissions to air (also radioactive) and water and wastes have been picked out from or calculated based on literature for all phases of the life cycle.
All subsystems are described on a ''cradle-to-grave'' basis, including the main stages, i.e. data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle.

Detailed description

Mining and processing I
The prospecting of coal implies test drillings etc but is not inventoried separatly since only a few millimeters of drilling per tonne coal is needed.
Production of explosives used is included. Radioactive radon, methane and particles are process specific emissions to air and subsoilwater to water.

Open pit mining (28% of used stone coal in UCPTE) is used when the coal is found at a depth of a few to 500 meters. The subsoil water level must be lowered below the seam. Mainly diesel driven mobile machines are used. Underground mining (72% of used stone coal in UCPTE) involves the construction of shafts and galleries and the use of mainly electric hoists etc. Typical coal depths are 100-1200 meters. Emitted methane is partly used as fuel. Air condition and cooling plants are included.

The average loss of extracted coal in the mechanic processing plant is assumed to be 30% of the weight for open pit mines and 40% of the weight for underground mines. The assumed average energetic loss however is 5% and 8% respectively. The advantages of processing is for example higher heating value, lower sulphur content, less transports and better furnace conditions. All stone coal is supposed to be processed in this study.

Construction and operation of mines and processing plants are inventoried. Demolition processes are assumed to be neglectable, transports and deposit areas are however included.

Processing II
Most of the coal used in power plants in the UCPTE is steam coal coming directly from the first processing plant but in Germany also coke is used (about 18 % of the use in UCPTE). In the cokery coal is degassed in four steps at increasing temperatures. The products are several, coke typically 79% by weight. The cokery is assumed to be supplied with coke gas. Construction phase and area use has been estimated.

Transports and storage
Transports of stone coal from 6 supply regions have been inventoried regarding distances, vehicles and transshipment. Coal losses and emissions of particles (relatively large) during transport have been estimated. Coal storages are included, their emissions to air and leaching water (rough figures). Coal storages emit CO2 due to oxidation of coal, these emission are assumed to happen in the power plant in the ETH calculations. Construction and scrapping of vehicles are included.

Power plant
Construction and area use has been inventoried for two standard plants (100 and 500 MWe). The smaller standard plant is equiped with electrofilter and wet desulphuring with lime or limestone, the larger plant has a SCR de-NOx device as well. 90% of the UCPTE stone coal power plants are assumed to belong to the 500 MWe class. The plants are medium load power plants with an average of 4000 h of operation per year. Furnace technology is conventional (i.e. no gasifyers or fluid beds). Average efficiencies of power plants have been calculated (35.7%) based on national statistics. Incoming coal to the UCPTE power plants (average heating value 25,1 MJ/kg) is mixed, grinded and dried. Furnace temperatures of 1,300°C giving fly ashes or 1,600°C leading to ash melting are used. Concerning conventional emissions to air national statistics and bottom-up calculations based on existing UCPTE power plants have been used. Emissions of trace elements are estimated and other emissions are calculated based on literature data. Oil-fuelled starting plant is included. Leaching of substances from deposited ashes is included.

* Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

System Boundaries

Nature Boundary

Used materials and energyware have been followed from extraction and processing of natural resources. Maufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included).

Land is divided into two main groups - land and sea - which are subdivided into 4 categories each.

Land Criterion Category
Natural human impact not larger than other species' since the industrial revolution I
Modified human impact larger than other species', low degree of cultivation II
Cultivated human impact larger than other species', large degree of cultivation III
Built upon dominated by buildings, roads, dams, mines etc. IV

Category I is not used in the study.

State of land before, during and after exploitation is of interest. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a

	higher one. ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. They express use of land in the unit m2year which is different from comparable Swedish studies (m2). See times for restoration of land below: From category IV to category III 5 years From category III to category II 50 years From category II to category I 100 000 years (For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.) ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH.
Time Boundary	Most background data refer to the period 1990 to 1994. Concerning flue gas cleaning equipment data from 1995/96 has been used where possible. Figures regarding use of materials and mining and processing of coal are older which probably doesn´t affect the result much. Future emissions from deposits for filter ashes are included. The amounts of imported coal to the UCPTE are based on the year 1993. Power plant operation is based on the year 1994. Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPTE* countries between 1990-94 (to level off the large variations in hydro power production over the years). All processes, also those conducted in the past, have been assumed to use average technology of the early nineties. Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows: Equipment in mines 30 years Cokery 30 years Power plant 40 years * Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.
Geographical Boundary	Figures are based on average stone coal power plants in Austria, Belgium, Spain, Italy, Ex-Jugoslavia, France, Netherlands, Portugal, and Germany. The emphasis concerning the inventory of coal mining is the UCPTE but also North and South America, South Africa, Australia&The Far East and Eastern Europe have been regarded since those regions export hard coal to the UCPTE. About 45% of stone coal used in UCPTE power plants is imported from those other regions. Processes conducted outside the UCPTE* region are supposed to be supplied with UCPTE* electricity. Data concerning the use of ressources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries. * Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.
Other Boundaries	Data concerning material and energyware use in the construction phase of the mine are rough estimates based on a few real mines. Process specific (i.e. not energyware related) emissions to air from mines have not been included except for radon, methane and particles. The flow of substances in subsoil water is not complete and emissions due to leaching from heaps are rough estimates which probably has an influence on the results. Use and emissions of lubricating and hydraulic oil is not included. Emissions of N2O, dioxines and radioactive substances from cokeries are not included (emissions of other greenhouse gases, hydrocarbons (also aromatic), heavy metals and inorganic substances are included). No accidents were considered in the cokery. Emissions of heavy metals found in emitted particles during transport of coal has not been considered. Emissions of benzene, toluol and xylol from long-time coal storages are not included (emissions of heavy metals and hydrocarbons to water are however included). Accidents are not considered in the power plant. Most data concerning the power plant are based on assumptions and estimates. Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPTE electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH:s LCA for coal power. Big accidents occuring seldomly are not included.The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.
Allocations	Allocation in the cokery between the products have been studied according to energy content, weight and price. The results gave an allocation of 76-83% on the coke. In the ETH study 80% has been allocated to coke. The cutoff-method has been used for material use, i.e. 100% of the environmental load for

	virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1985 to 1995
Data Type	Derived, unspecified
Represents	Average electricity generation with stone coal in the UCTPE countries.
Method	The figures have been copied from the module ''Electricity stone coal power plant UCPTE'' (Strom ab Steinkohlekraftwerk UCPTE-Mix) in the Ökoinventare von Energiesystemen, ETH Zürich 1996.
Literature Reference	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
Notes	Multiple flows are reported for several emissions to air. This is because that in the original study emissions to air have been reported in three categories, indicated by one of the letters below following the substance name. - m = mobile (emissions from vehicles) - p = process (process specific emissions as for instance methane emissions during coal mining) - s = stationary (emissions from stationary combustion plants) This categorisation has however not been documented in this specification in the SPINE format.

About Inventory

Publication	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at http://www.energieforschung.ch. --- Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden Documentation reviewed by (see also Notes): Rolf Frischknecht, ESU-services, Switzerland Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden ---
Intended User	Original study of ETH: LCA pra
General Purpose	The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their life cycles. The results can be used in life cycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans.
Detailed Purpose	ETH:s aim was to describe the average situation in the UCPTE concerning electricity generation with stone coal. With the help of assumptions and simplifications following phases of the life cycle are described: mining (open pit and underground)), processing, transports, storage and power plant.

Commissioner	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
Practitioner	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villingen/Würenlingen .
Reviewer	None, see further under notes -
Applicability	Data reported here is supposed to be representative for stone coal based electricity generation in the UCPTE countries in 1994. Figures for the cokery included in the study are representative for Germany, European cokeries probably have larger emissions.
About Data	Most data concerning coal power are based on assumptions and estimates. Emissions of CO2, SO2, NOx, particulates and heat are quite reliable however. Since 45% of coal used in UCPTE power plants is imported and mines in the exporting regions often are supplied with fossil electricity, data does probablynot match with realemissions from electricity generation (underestimation of fossil pollutants, overestimation of radionuclide emissions and nuclear waste generation). Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided). Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16). For references and sources of reported figures see further under Function, Nature boundary, Geographical boundaries, Publication, Notes and General metadata.
Notes	Reviewer of this specification of metadata describing the ETH study has been: Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of Vattenfall's interpretation ot the documentation Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data documentation requirements. Project Management of the ETH study, 3rd edition: Professor, Dr. P. Suter and R. Frischknecht, ETH Editorial staff of the 1st edition: R. Frischknecht, P. Hofstetter, I. Knoepfel, M. Ménard, ETH R. Dones, E. Zollinger, Paul Scherrer Institut Authors of the 1st edition: N. Attinger, T. Baumann, G. Doka, R. Dones, R. Frischknecht, H.-P. Gränicher, C. Grasser, P. Hofstetter, I. Knoepfel, M. Ménard, H. Müller, M. Vollmer, E. Walder, E. Zollinger Authors of the revision, 3rd edition: U. Bollens, S, Bosshart, M. Ciot, L. Ciseri, G. Doka, R. Frischknecht, R Hischier, A. Martin, ETH R. SPINE LCI dataset: Storage and distribution of chemicals and intermediate storage of hazardous waste.

Administrative	
Finished	Y
Date Completed	1997-03-01
Copyright	
Availability	Public

Technical System	
Name	Storage and distribution of chemicals and intermediate storage of hazardous waste.
Functional Unit	1996
Functional Unit Explanation	The extent of the production is not mentioned in the Environmental report. Because of this we have no functional unit which makes it impossible to use the data direct for life cycle analysis. Though, it is possible to get in touch with the company and try to get some more information.
Process Type	Gate to gate
Site	Stena Miljö AB Salsmästaregatan 21 422 46 Göteborg Sweden
Sector	Waste sorting and collection
Owner	Stena Miljö AB Salsmästaregatan 21 422 46 Göteborg Sweden

Technical system description	Storage and distribution of photo chemicals and intermediate storage of waste that is hazardous to the environment from graphic and photographic activities.

System Boundaries

Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries	
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1996
Data Type	Unspecified
Represents	Average electricity generation with stone coal in the UCTPE countries.
Method	Study the environmental report from Stena Miljö AB for 1996. The amounts in the table are taken directly from the environmental report, and shows the resourses, residues and emissions for the annual production of 1996.
Literature Reference	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
Notes	The data represents a total amount for 1996.

About Inventory	
Publication	Environmental report from Stena Miljö AB for 1996, The Environmental Administration in the municipality of Göteborg. -- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg. .
Practitioner	Lundahl, Hans - Stena Miljö AB Salsmästaregatan 21 422 46 Göteborg Sweden.
Reviewer	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg.
Applicability	The function of the technical system is not sufficently described. Contact the company to get the necessary details. The extent of the production is not mentioned in the Environmental report. Because of this we have no functional unit which makes it impossible to use the data direct for life cycle analysis. Though, it is possible to get in touch with the company and try to get some more information.

SPINE LCI dataset: Storage of ammonia

Administrative	
Finished	Y
Date Completed	1999-01-25
Copyright	
Availability	Public

Technical System	
Name	Storage of ammonia
Functional Unit	1 kg of ammonia (stored)
Functional Unit Explanation	
Process Type	Gate to gate
Site	Hydro Agri AB Box 516 SE-261 24 Landskrona Sweden
Sector	Materials and components
Owner	Hydro Agri AB Box 516 SE-261 24 Landskrona Sweden
Technical system description	At Hydro Agri AB in Landskrona, the ammonia is stored before it is used in the production of fertilisers. This dataset should only be used in the aggregated dataset for production of CAN fertiliser (cradle to gate) as it is specific for the production site in Landskrona.

System Boundaries	
Nature Boundary	The only emission taken into account is N-tot to water.
Time Boundary	The data are figures for production in 1997.
Geographical Boundary	Hydro Agri AB in Landskrona, Sweden.
Other Boundaries	
Allocations	Not applicable.
Systems Expansions	Not applicable.

About Inventory	
Publication	Davis J, Haglund C (1999). ''Life Cycle Inventory (LCI) of Fertiliser Production - Fertiliser Products Used in Sweden and Western Europe''. SIK report no. 654. The Swedish Institute for Food and Biotechnology (SIK). Gothenburg, Sweden. -- Data documented by: Jennifer Davis, SIK (The Swedish Institute for Food and Biotechnology). Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	The dataset is intended to be

General Purpose	To generate an inventory over emissions and use of resources for the production of fertilisers used in Sweden.
Detailed Purpose	The purpose was not to compare the production of different fertilisers with each other but to generate a thorough inventory of emissions and use of resources due to the production of different mineral fertilisers. Storage of ammonia is one step in the production of CAN fertiliser at Hydro Agri AB in Landskrona. The data are intended to constitute a useful basis of input information in life cycle assessments of food production systems.
Commissioner	- SIK AB, The Swedish Institute for Food and Biotechnology Box 5401 SE-402 29 Gothenburg Sweden .
Practitioner	Davis, Jennifer and Caroline Haglund - SIK AB Box 5401 402 29 Gothenburg Sweden.
Reviewer	-
Applicability	The dataset is applicable for storage of ammonia at Hydro Agri AB in Landskrona. The dataset is included in the aggregated dataset for production of CAN fertiliser at Hydro Agri AB in Landskrona (cradle to gate).
About Data	Data are collected from the official environmental report distributed by Hydro Agri AB in Landskrona and also by contact with Ronnie Persson at Hydro Agri AB in Landskrona.
Notes	Internal review of the report was performed by: Olle Ramnäs, CTH (Chalmers University of Technology), Berit Mattsson and Magnus Stadig, SIK (The Swedish Institute for Food and Biotechnology).

SPINE LCI dataset: Sugar beet cultivation. ESA-DBP

Administrative	
Finished	Y
Date Completed	2005
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Sugar beet cultivation. ESA-DBP
Functional Unit	1 ha field of sugar beet
Functional Unit Explanation	(NB: no information about the amount of the sugar beet per ha)
Process Type	Cradle to gate
Site	Unknown
Sector	Crop and animal production, hunting etc.
Owner	Unknown
Technical system description	Sugar beet is an ingredient of 'Soy-Dog' which is the object of the study. This process is included in the system described in: Abelmann A. (2005). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf Other processes in the CPM Database also included in the above publication: - Sausage (Soy-Dog) production. ESA-DBP - Sausage (Pea-Dog) production. ESA-DBP - Sausage (Hot-Dog) production. ESA-DBP - Operation of 'Hot Dogs' producing facility. ESA-DBP - Pea cultivation. ESA-DBP - Production of beef. ESA-DBP - Production of pork. ESA-DBP - Rape seed cultivation. ESA-DBP - Wheat cultivation. ESA-DBP - Soy bean processing. ESA-DBP - Soy bean cultivation. ESA-DBP

System Boundaries	
Nature Boundary	Refined resources, energy use and emissions are included in the study.
Time Boundary	The data come from the year 2004.

Geographical Boundary	The study was done for Sweden.
Other Boundaries	Unknown
Allocations	No information about the allocation in the report.
Systems Expansions	Not applicable

Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The overall aim of the study is to assess the potential environmental impacts of substituting animal protein for regionally grown vegetable protein in food products.''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The objective is to analyze three food products of the same type, and the purpose is to compare the environmental impact of the products and also to identify the most important contributors of the total environmental impact of each product. The products are described as follows. - a product in which all protein is animal protein. - a product in which 10% of the animal protein is replaced with vegetable protein. - a product in which all protein is vegetable protein. Furthermore, the objective is to provide useful information on the products that can be used in other environmental systems analysis, e.g. in meal studies.

Availability	Public

Technical System	
Name	Sugarcane cultivation. ESA-DBP
Functional Unit	25.2 kg of sugarcane
Functional Unit Explanation	25.2 kg of sugarcane is used in order to produce 1 kg of LDPE which is the object of the study.
Process Type	Cradle to gate
Site	Unknown
Sector	Crop and animal production, hunting etc.
Owner	Unknown
Technical system description	Excerpt from the report: ''The cultivation of sugarcane is a cycle consisting of one planting run and several ratoon runs. The planting run starts with an intensive soil preparation. It includes mechanical treat-ment like sub soiling and harrowing as well as chemical treatment in form of fertilizer appli-cation. After that, the soil is furrowed, phosphate fertilizers and seed pieces are put into the furrow, which then is closed and another load of fertilizers and herbi-cides is applied. The furrowing and fertilizer application is repeated one to two times in the first year of cultivation. 12-18 months after the planting the cane is ready for harvesting. There are two different harvesting methods: manual harvesting, including the burning of the field before the harvest and mechanical harvesting not necessarily including pre-burning. From the field the harvested cane is transported to the mills and processed to ethanol. Now the ratooning begins. Fertilizers and herbicides are spread and the cane starts regrowing from the left rootstock. Again, after 12-18 months, it can be harvested and a new ratooning starts. In total four ratoonings are done before the old cane is ploughed out. The ratooning is not done infinitely as the harvest decreases with every ratoon run.'' This process is included in the system described in: Liptow Ch., Tillman A.-M. (2009). Comparative life cycle assessment of polyethylene based on sugarcane and crude oil. Environmental Systems Analysis, Report 2009:14, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2009--14.pdf Other processes in the CPM Database also included in the above publication: - Ethylene production from cane based ethanol. ESA-DBP - Refinery in crude oil based LDPE production process. ESA-DBP - Polymerization in crude oil based LDPE production process. ESA-DBP - Steam cracking in crude oil based LDPE production process. ESA-DBP

System Boundaries	
Nature Boundary	Excerpt from the report, see 'Publication': ''Outputs accounted for in this study were by-products and emissions released to air. Water emissions were omitted, because of data unavailability for some parts of the sugarcane route. Energy consumed along the process chain was traced back to the extraction of the energy carriers (fuels) needed for its generation.''
Time Boundary	Data for the cultivation come from the year 2004 and energy data from 2008 and 2009.
Geographical Boundary	The study was done for Brazil.

Other Boundaries	Excerpt from the report, see 'Publication': ''The following operations were not included: 1. production and maintenance of capital goods form buildings and machinery (their impacts were set to be insignificant), as well as, 2. Operations included in personnel employment, like supply with housing, food, etc., is not counted.(...) The attributional approach used electricity data representing average Brazilian electricity production. Assumptions set: - building construction & maintenance are not included - equipment construction & maintenance are not included (...) - manual harvesting under attributional LCA - share newly planted cane 0,2; share ratoon cane 0,8 - LHV diesel = 36,4 MJ/l - vehicle type 7-20t; load 50%; speed 49 km/h; euro 2 - LHV ethanol = 31,45 MJ/kg''
Allocations	Excerpt from the report, see 'Publication': ''allocation in attributional approach based on energy content i.e. electricity generated from surplus bagasse in relation to energy content of ethanol''
Systems Expansions	Not applicable

Flow Data

General Activity QMetaData

Date Conceived	2004
Data Type	Derived, unspecified
Represents	See 'Function'
Method	Excerpt from the report, see 'Publication': ''Data availability is a general problem of LCA and the cultivation of sugarcane in Brazil is no exception. Only few authors publish on this issue and the fact that practically all well-to-wheel studies are based on only one author (Macedo) out of these few further limits data diversity and availability. Another problem related to Brazilian sugarcane cultivation is the prediction of technical changes for agricultural operations. Although the Brazilian legislation released different laws concerning the cultivation of sugarcane and its processing, it is uncertain to what extent they will be applied. For these reason, the attributional and consequential assessment of the sugarcane cultivation used the same data originating from a report published by Macedo in 2004. Next to this report, data from Ometto et al. (2009) and Bernesson (2004) were used to assess the environmental impact of the production of fertilizer and pesticides, applied during the sugarcane cultivation. The environmental impact of the consumed fuels (consumption data according to Macedo (2004)) was assessed, using data from the database SPINE LCI (2008) and NTM (2009) - these databases were also used for the environmental assessment of all processes' fuel consumption. Emissions from Land Use change were assessed using data from the California EPA (2009) and Zuurbier and van de Vooren (2008). (...) Attention must be paid that the assessed resource consumption and the resulting release of emissions differ between the attributional and consequential approach.''

About Inventory

Publication	Liptow Ch., Tillman A.-M. (2009). Comparative life cycle assessment of polyethylene based on sugarcane and crude oil. Environmental Systems Analysis, Report 2009:14, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2009--14.pdf
Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The goal of this study is to answer the question, is the use of sugarcane based LDPE in the production of goods and packing in Sweden environmentally preferable to crude oil based LDPE.''
Detailed Purpose	Sugarcane cultivation is a step in the production process of sugarcane based LDPE so it was necessary to investigate the environmental load of it.
Commissioner	Unknown - .

Practitioner	Christin Liptow & Anne-Marie Tillman - Environmental Systems Analysis, Chalmers University of Technology.
Reviewer	Tillman, Anne-Marie - Environmental Systems Analysis, Chalmers University of Technology
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above
About Data	ESA database project. Years 2009-2011. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: The Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	Sugarcane cultivation is a step in a production process of sugarcane based LDPE which was the object of the study. The production process starts with cane cultivation, ethanol production, ethylene production, polymerization, use phase (which is not included in the study) and ends with incineration. In the study sugarcane based- was compared with oil based- LDPE. NB: in the report two approaches were investigated: attributional and consequential. For consequential approach see the report.

SPINE LCI dataset: Surface Coating of bearing roller

Administrative	
Finished	Y
Date Completed	2002-12-12
Copyright	
Availability	Public

Technical System	
Name	Surface Coating of bearing roller
Functional Unit	1 bearing 1 year
Functional Unit Explanation	The function of a bearing at its place in the soft calender section, with all its components.
Process Type	Unit operation
Site	Halmstad
Sector	
Owner	Halmstad
Technical system description	This activity describes a process step included in the process coating of bearing rollers which takes place at Baltzer, Sweden. The rollers are manufactured to SKF spherical roller bearing 232/530. Surface coating of bearing roller: The surface of the roller is coated with a multi-layered coating via high vacuum PVD. The chamber, that can be loaded with 24 rollers of the size 232/530, is evacuated from air. Then the rollers are heated via induction to reach a temperature suitable for the condensation of metal particles. Argon and acetylene are introduced in the chamber and a potential is applied. Argon is ionised, some ions etch the roller surface. Other hit the targets of chrome or tungsten carbide and this causes atoms from the target material to vaporise and sputter against the rollers where they condense. First a thin binding layer of chrome is created, then several layers of WC/C. The carbon layer is created when the argon ions hits the acetylene gas. The chamber is cooled with helium. Afterwards the rollers are treated with a corrosive protecting agent, Tectyl. For further reading about Coating of bearing rollers read Environmental Report from year 2001 Balzers Sandvik Coatings AB and Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Thechnology, December 2002.

System Boundaries	
Nature Boundary	The system has an inflow of target materials, gases, energy and rollers, that is they all come from the technosphere. The outflows are coated rollers and waste gas that leaves for the technosphere. Emissions to air and water are not included in this dataset since no information was available.

Time Boundary	The report from which the data is taken is published year 2001. No changes planned for the nearest future.
Geographical Boundary	This coating process takes place in Halmstad, Sweden.
Other Boundaries	The material on the targets cannot be fully used. A chrome target for example weighs 7,3 kg new, including the steel frame. Only about 1 kg crome is used, then the target is wasted. In this study only the amount of crome used for the coating is handled for simplicity reasons. Production of electricity is not included in this dataset.
Allocations	The total amount of energy and materials used during a year is divided to give an equal amount for each coating batch. This amount is then divided in 24, since there are 24 rollers size 232/530 in each batch. This gives the amount of used energy and materials for the coating of one roller. There are 36 rollers in each roller bearing size 232/530. The coated bearings lifetime is 6 years, which means that all numbers are multiplied with 6 to give the yearly consumption.
Systems Expansions	Not applicable

About Inventory

Publication	Environmental Report from year 2001 Balzers Sandvik Coatings AB Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Thechnology, December 2002. ------------- Data documented by Sandra Häggström, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-03-21.
Intended User	Product developer at SKF and B
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.

Detailed Purpose	The purpose for our study is to compare a coated roller bearing to a non-coated, from cradle to grave. The coating is preceeded by a cleaning treatment.
Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Sandra Häggström - .
Reviewer	Olle Ramnäs -
Applicability	The dataset describes a coating process that is conducted in order to strengten the surface of metal components and tools. Care has to be taken to substrate size, both the energy consumption and the target material consumption depends on substrate size. The dataset is compiled for rollers RS-232/530 C in SKF roller bearings size 232/530.
About Data	All data are gathered from a specific site, the Balzers Sandvik Coatings AB in Halmstad, Sweden. The data have been measured by the company (Balzers) and is reported in their environmental report for year 2001. The calculations are based on economical value, purchased amount of chemicals.
Notes

About Inventory

Publication	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8. -- Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden --
Intended User	LCA practitioners
General Purpose	The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.
Detailed Purpose	The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.
Commissioner	Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .
Practitioner	Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .
Reviewer	CPM -
Applicability	The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in ''Represents'' in QMetaData for each specific flow. When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations: - Biofuel electricity energy system, EPD-version - Fuel gas electricity energy system, EPD-version - Hydro electricity energy system, EPD-version - Lignite electricity energy system, EPD-version - Nuclear electricity energy system, EPD-version - Oil electricity energy system, EPD-version - Stone coal electricity energy system, EPD-version - Wind electricity energy system, EPD-version The following countries and regions have been documented in the database: Australia, electricity generation mix 1998 Austria, electricity generation mix 1998 Belgium, electricity generation mix 1998 Canada, electricity generation mix 1998 Czech Republic, electricity generation mix 1998 Denmark, electricity generation mix 1998 European Union, electricity generation mix 1998 Finland, electricity generation mix 1998 France, electricity generation mix 1998 Germany, electricity generation mix 1998

Technical System	
Name	Swedish average electricity AGGR
Functional Unit	1 kWh
Functional Unit Explanation	
Process Type	Cradle to gate
Site	
Sector	Grid electricity and district heat
Owner	
Technical system description	The Swedish average electricity production comes from hydropower, nuclear power, combined heat and power plant, oil condensing plants, gas turbines, and wind power. Thus, the Swedish electricity production system consists of a large number of power plants based on different technique and with very different environmental impact. The base in the system is hydropower and nuclear power. The remaining part is mainly produced by fossil fuels through combined heat and power. A small share of the electricity is produced in condensing plants or gas turbines. The thermal power stations are primarily run during the winter half, when the supply of hydropower and nuclear power are not sufficient to meet the demand for electricity. In order to know more about the technical system of each power plant included in this study, see the data sets, respectively.

Technical System	
Name	Swedish electricity production system
Functional Unit	1 kWh
Functional Unit Explanation	Production of 1 kWh electricity
Process Type	Other
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	The Swedish electricity production system consists of a large number of power plants based on different technique and with very different environmental impact. The base in the system is hydropower and nuclear power. The remaining part is mainly produced by fossil fuels through combined heat and power. A small share of the electricity is produced in condensing plants or gas turbines. The thermal power stations are primarily run during the winter half, when the supply of hydropower and nuclear power are not sufficient to meet the demand for electricity.

System Boundaries	
Nature Boundary	N/A
Time Boundary	The data is applicable for a normal year of electricity production.
Geographical Boundary	Only electricity produced in Sweden is considered. Import or export of electricity is not included.
Other Boundaries	
Allocations	N/A
Systems Expansions	N/A

Flow Data	
General Activity QMetaData	
Date Conceived	1997
Data Type	Derived, unspecified
Represents	See 'Function'
Method	The share of the different power sources of the total electricity production have been calculated by dividing the total electricity production of each power source with the total electricity production in Sweden during a normal year of electricity production. The total electricity production during a normal year is 144 TWh.
Literature Reference	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8, page II.300.
Notes	The power sources that produce the different shares of electricity can be found under Notes for each specific flow into the system.

About Inventory	
Publication	-- Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	
General Purpose	
Detailed Purpose	To calculate the environmental load from electricity produced in Sweden, using the data for the environmental impact of electricity production of different power sources found in Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S.,''Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport'', Vattenfall AB, 1996
Commissioner	
Practitioner	Skalsky, Edmund - Kraftverksföreningen Olof Palmes gata 31, 6 tr. 101 53 Stockholm .
Reviewer	
Applicability	The environmental impact of the electricity production system can be calculated using data for the environmental impact of different power sources found in Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S.,''Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport'', Vattenfall AB, 1996. Data for fuel production, operation and maintenace and handling of rest products for the following power sources can be used from this report: *Hydropower* *Nuclear power* *Combined heat and power* with a conventional steam cycle with a circulating fluidisation bed, equipped with flue gas condensing equipment (CFB-KVV), fired with wood fuel *Oil condensing power* *Gas turbine power* All electricity produced from combined heat and power has been assumed to be produced by wood fuel fired combined heat and power plants. This is a reasonable assumption since the share of electricity produced by combined heat and power is small, compared to the total electricity production. Combined heat and power plants are also being rebuilt to be fired with wood fuels. The data are applicable for a normal year of electricity production. A normal year means a year with normal water supply, i.e. medianflow during the flowseries 1950-1990, and normal supply in the twelve Swedish nuclear power units. Import or export is not included. It is not possible to give the normal import or export since the variations during the year are quite large. With the normal electricity production that is stated (144 TWh) and the electricity use during the last 2 years (142 TWh), there has been a net export of approx. 2 TWh.
About Data	Kraftverksföreningen assemble data for the production on a weekly and monthly basis from all major electricity producers. The National Statistics Office of Sweden assemble data for both gross and net production from every electricity producer in Sweden on an annual basis.
Notes	

SPINE LCI dataset: Swedish red paint manufacturing and application. ESA-DBP

Administrative	
Finished	Y
Date Completed	1999

Availability	Public.

Technical System

Name	Swedish red paint manufacturing and application. ESA-DBP
Functional Unit	1 m2 * year
Functional Unit Explanation	1 m2 painted with Swedish red paint over one year.
Process Type	Gate to gate
Site	Not applicable
Sector	Consumer goods
Owner	Not applicable
Technical system description	Swedish red paint is an exterior coating of buildings. The data includes manufacturing of paints and paint components, transporatation of materials and products and application of paints. This process is included in the system described in: Blanco-Rosete S. R., 2002, LCA data structure and time series related to construction and maintenance in Sweden. Environmental Systems Analysis report 2002:14, Chalmers University of Technology, Gothenburg, Sweden Other processes in the CPM Database also included in the above publication: Clay roof tile manufacturing. ESA-DBP Exterior coating (Swedish red paint) maintenance. ESA-DBP Pine window production. ESA-DBP Floor maintenance. ESA-DBP

System Boundaries

Nature Boundary	Excerpt from the report (see 'Publication'): ''The study includes manufacturing of paints and paint components, transporatation of materials and products and application of paints. However the study is not clear if the manufacture of paint components starts from the raw material.''
Time Boundary	1999
Geographical Boundary	Sweden
Other Boundaries	Excerpt from the report (see 'Publication): ''The study includes manufacturing of paints and paint components, transporatation of materials and products and application of paints.''
Allocations	Not applicable.
Systems Expansions	Not applicable.

About Inventory	
Publication	Blanco-Rosete S. R., 2002, LCA data structure and time series related to construction and maintenance in Sweden. Environmental Systems Analysis report 2002:14, Chalmers University of Technology, Gothenburg, Sweden
Intended User	LCA practitioners.
General Purpose	This process data set is recalculated to fit in the Master Thesis given in 'Publication'. Excerpt from the report (see 'Publication'): ''Construction, building maintenance and housing management contribute to a large extent to the environmental impact. When housing owners and managers perform their activities they should be aware of the environmental effects they cause. The environmental impact of existing houses could be addressed and diminished within the possibilities of a clever management.''
Detailed Purpose	Excerpt from the report (see 'Publication'): ''This master thesis descibes and defines a building system model for a multi-family house in Gothenburg over a 30 year period from 1970 to 2002 . The model was used to collect environmental impact information regarding materials or products used in the construction and maintenance of a building . The environmental impact ofa a multi-family house was evaluated through a Life Cycle Assessment (LCA). Finally to account the long sevice lifetime of a multi-family house two case studies were carried out to test if the use of Time series can illustrate the environmental impact of maintenance activities caused by decisionmaking in housing management.''
Commissioner	Not applicable - .
Practitioner	Sergio R. Blanco-Rosete - .
Reviewer	Birgit Brunklaus - Environmental Systems Analysis
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries'.
About Data	The functional unit in the original data set was the amout of paint covering 20 square meter of surface with 98% coverage. When the calculations for the LCI of the new building system model were performed the original data was modified to fit according to the functional unit of this study. ESA Database Project. Years: 2009-2011. Documentation completed for this data set: 2010-09-21 Administering organisation: Chalmers University of Technology, the division of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA). Review committee for documented data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).

Technical System

Name	Swedish reinforcement steel mix
Functional Unit	kg
Functional Unit Explanation	1 kg reinforcement steel
Process Type	Other
Site	Sweden
Sector	Materials and components
Owner	Sweden
Technical system description	This data represents an allocation method and not a technical system. The allocation method reflects the Swedish market of reinforcement steel.

System Boundaries

Nature Boundary	
Time Boundary	
Geographical Boundary	Sweden
Other Boundaries	
Allocations	Several principles for how the environmental load has to be split, when the material goes through several life cycles, are further described and discussed in Lindfors L-G et al. (LCA-NORDIC. Technical Reports No 1-9. Nord 1995:502, Nordic Council of Ministers, Copenhagen, 1995). In this study we have for steel chosen to use the 50/50 method. 50% of the environmental load caused by primary production and waste management are allocated to the first life-cycle and the remaining 50% are allocated to the last life-cycle (i.e. when the material is taken out of the defined system). Of environmental impacts caused by a recycling process between two user periods, 50% are allocated to the previous and 50% to the following life cycle. When using the 50/50 method on reinforcement steel, the data mix will consist of 50% of the previous recycling process (100% scrap-based production) and 50% of the ore-based production since. Thus, the data mix used in the calculations will for reinforcement steel be 50% ore-based and 50% scrap-based production.

About Inventory

Publication	LCA of Building Frame Structures Environmental Impact over the Life Cycle of Concrete and Steel frames; Björklund T., Jönsson Å., Tillman A-M.; Report 1996:8; TEP; CTH; Göteborg; Sweden -- Data documented by: Maria Erixon, project employed for the database project at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Thomas Björklund, Technical Environmental Planning, Chalmers University of Technology --
Intended User	To make an LCA of building fra
General Purpose	Among others, to analyse and assess the environmental impact of structural concrete and steel frames in buildings during the whole life-cycle by using the method of LCA as a tool.
Detailed Purpose	To calculate the environmental load of steel
Commissioner	- Finncement Finland .
Practitioner	Björklund T., Jönsson Å., Tillman A-M - Technical Environmental Planning, CTH Sven Hultins Gata 8 412 96 Göteborg Sweden .
Reviewer	
Applicability	There are several principles for how the environmental load has to be split when the material goes through many life cycles. These are further described and discussed in Lindfors L-G et al. (LCA-NORDIC. Technical Reports No 1-9. Nord 1995:502, Nordic Council of Ministers, Copenhagen, 1995). You can find the data for ore-based and scrap-based steel production in this Database: Name: Ore-based steel production Category: Cradle to gate Publication: LCA of Building Frame Structures Environmental Impact over the Life Cycle of Concrete and Steel frames; Björklund T., Jönsson Å., Tillman A-M.; Report 1996:8; Technical Environmental Planning; Chalmers University of Technology, Göteborg, Sweden Name: Scrap-based steel production Category: Gate to gate Publication: LCA of Building Frame Structures Environmental Impact over the Life Cycle of Concrete and Steel frames; Björklund T., Jönsson Å., Tillman A-M.; Report 1996:8; Technical Environmental Planning; Chalmers University of Technology, Göteborg, Sweden
About Data	This 50/50-allocation method is chosen to promote the recycling of steel. According to discussions with the steel industry, the main part of reinforcement steel used in Sweden is also produced in Sweden, though some reinforcement steel is also imported. It is probable that also the imported products are based on scrap. Thus, in the calculations it is assumed that all reinforcement steel used in Sweden is based on scrap.

Allocations	In this study we have chosen to use the 50/50 method. 50% of the environmental load caused by primary production and waste management are allocated to the first life cycle, and the remaining 50% are allocated to the last life-cycle (i.e. when the material is taken out of the defined system). Of environmental impacts caused by a recycling process between two user periods, 50% are allocated to the previous and 50% to the following life cycle. For sheet steel products, it is assumed in the calculations that all products are recycled after use. This means that, when using the 50/50 method, the input data in the calculation model will for 1 kg sheet steel consist of 50% of the environmental load of the average sheet steel used today (75% ore-based and 25% scrap-based production) and 50% of data for the succeeding recycling process (100% scrap-based steel production). The final data mix for sheet steel will then be 37.5% ore-based and 62.5% scrap-based steel production. Several principles for how the environmental load has to be split, when the material goes through several life cycles, are further described and discussed in Lindfors L-G et al. (LCA-NORDIC. Technical Reports No 1-9. Nord 1995:502, Nordic Council of Ministers, Copenhagen, 1995).

About Inventory

Publication	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8. --- Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden ---
Intended User	LCA practitioners
General Purpose	The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.
Detailed Purpose	The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.
Commissioner	Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .
Practitioner	Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .
Reviewer	CPM -
Applicability	The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in ''Represents'' in QMetaData for each specific flow. When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations: - Biofuel electricity energy system, EPD-version - Fuel gas electricity energy system, EPD-version - Hydro electricity energy system, EPD-version - Lignite electricity energy system, EPD-version - Nuclear electricity energy system, EPD-version - Oil electricity energy system, EPD-version - Stone coal electricity energy system, EPD-version - Wind electricity energy system, EPD-version

	The following countries and regions have been documented in the database: Australia, electricity generation mix 1998 Austria, electricity generation mix 1998 Belgium, electricity generation mix 1998 Canada, electricity generation mix 1998 Czech Republic, electricity generation mix 1998 Denmark, electricity generation mix 1998 European Union, electricity generation mix 1998 Finland, electricity generation mix 1998 France, electricity generation mix 1998 Germany, electricity generation mix 1998 Greece, electricity generation mix 1998 Hungary, electricity generation mix 1998 Iceland, electricity generation mix 1998 Ireland, electricity generation mix 1998 Italy, electricity generation mix 1998 Japan, electricity generation mix 1998 Korea, electricity generation mix 1998 Luxembourg, electricity generation mix 1998 Mexico, electricity generation mix 1998 Netherlands, electricity generation mix 1998 New Zealand, electricity generation mix 1998 Norway, electricity generation mix 1998 OECD Europe, electricity generation mix 1998 OECD North America, electricity generation mix 1998 OECD Pacific, electricity generation mix 1998 OECD total, electricity generation mix 1998 Poland, electricity generation mix 1998 Portugal, electricity generation mix 1998 Spain, electricity generation mix 1998 Sweden, electricity generation mix 1998 Switzerland, electricity generation mix 1998 Turkey, electricity generation mix 1998 United Kingdom, electricity generation mix 1998 United States, electricity generation mix 1998

SPINE LCI dataset: Tankers

Administrative	
Finished	Y
Date Completed	1994-04-01
Copyright	
Availability	Public

Technical System	
Name	Tankers
Functional Unit	tonkm
Functional Unit Explanation	The energy use and exhaust emissions are calculated with reference to the transportation of 1 ton goods, 1 kilometre.
Process Type	Unit operation
Site	
Sector	Sea transport
Owner	
Technical system description	Operation of a tanker

System Boundaries	
Nature Boundary	Emissions to air from combustion of the fuel are included. Other environmental impacts from the operation of the ship are not included.
Time Boundary	The aim was that the figures would represent the active fleet in 1992
Geographical Boundary	Sweden and other countries with a similar fleet

Other Boundaries	Utilisation level of the ship is not known. *Not included in the system:* Production and distribution of the fuel Manufacture and maintenance of the ship
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1990-1994
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	Data compiled from different literature sources. The emissions were calculated from emission factors; the emission factor for each specific substance was multiplied with the energy use for the given transport. The emission factors were: SO2 1,28 g/MJ NOx 2,5 g/MJ CO 0,22 g/MJ CO2 72 g/MJ HC 0,06 g/MJ Particles 0,11 g/MJ For details on how the emission factors were obtained, see metadata for each specific substance. Metadata for CO and HC can be found under CO. Metadata for SO2 and particles can be found under SO2.

Date concieved: 1992 Data type: Unspecified Method: Lenner has calculated average emission factors in g/tonkm, intended to represent an average value for all shipping in Sweden. They are therefore calculated for a combination of several types of ships. Emission factors in g/MJ were obtained by division of the emission factors in g/tonkm by the average energy use (0,051 g/MJ). Lenner has not stated how the values were retrieved. Literature: Lenner, M. \`Energiförbrukning och avgasemission för olika transporttyper\` VTI-meddelande nr 718, Statens Väg- och Trafikinstitut, 1993 Notes:	Output	Emission	CO	0.02			g	Air	
Date concieved: 1992 Data type: Modeled data Method: The emission factor was calculated from the fuel use (0,18 g/MJ) using the carbon content in diesel. The data used in the calculation was: Heat value: 42,82 MJ/kg Density: 0,83 kg/dm3 CO2 emission: 2,61 kg CO2/dm3 fuel Literature: Lenner, M. \`Energiförbrukning och avgasemission för olika transporttyper\` VTI-meddelande nr 718, Statens Väg- och Trafikinstitut, 1993 Notes:	Output	Emission	CO2	7.9			g	Air	
Notes:	Output	Emission	HC	0.007			g	Air	

Date concieved: 1990-1992 Data type: Unspecified Method: Lenner has calculated an *average emission factor* in g/tonkm, intended to represent an average value for all shipping in Sweden. They are therefore calculated for a combination of several types of ships. Emission factors in g/MJ were obtained by division of the emission factors in g/tonkm by the average energy use (0,051 g/MJ). The data was based on figures found in a document written by the Swedish Environmental Agency (Planeringsunderlag..). The emission factors in this document are given for four-stroke engines, and based on an investigation of exhaust emissions from shipping in Sweden made by Alexandersson. Data on specific emissions given in Alexandersson were mainly based on data from laboratory measurements by engine manufacturers but also measurements onboard three ships and other projects that has conducted measurements onboard sailing ships. Literature: Alexandersson, A. ''Sjöfartens utsläpp av avgaser'' TFB-meddelande nr 164, Transportforskningsdelegationen, Stockholm 1990. Lenner, M. ''Energiförbrukning och avgasemission för olika transporttyper'' VTI-meddelande nr 718, Statens Väg- och Trafikinstitut, 1993 Planeringsunderlag för samordnad investeringsplanering 1994-2003. Statens Naturvårdsverk 1992-04-15 Notes:	Output	Emission	NOx	0.28			g	Air
Notes:	Output	Emission	Particles	0.01			g	Air
Date concieved: 1990 Data type: Unspecified Method: Exhaust emission factors in g/tonkm can be read in figure 25 in Alexandersson. To obtain emission factors in g/MJ, Tillman has divided the emission factors in g/tonkm with an energy use of 0,47 MJ/tonkm Figure 25 in Alexandersson is based on total exhaust emissions and transportation by domestic shipping in Sweden 1987. It is not however clear how the background data for figure 25 were collected. Literature: Alexandersson, A. ''Sjöfartens utsläpp av avgaser'' TFB-meddelande nr 164, Transportforskningsdelegationen, Stockholm 1990.	Output	Emission	SO2	0.14			g	Air

About Inventory

Publication	Tillman, A-M. \`Goods transportation in life cycle assessment. Standard values for energy consumption and emissions.\` In: Life Cycle Assessment - Inventory Analysis Methodology: Overview, Recycling, Electricity and Transports, Swedish Waste Research Council (AFR) report nr 74, April 1995 -- Documentation and review of the report done by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	LCA practitioners
General Purpose	To fulfil a need for *standard values* to calculate energy use and exhaust emissions from goods transports.
Detailed Purpose	An update of standard values for energy use and exhaust emissions from an earlier investigation in: *Tillman, A-M., Baumann, H., Eriksson, E., Rydberg, T.* \`Livscykelanalyser för förpackningsmaterial - beräkning av miljöbelastning\` SOU 1991:77, Allmänna förlaget, Stockholm, 1991.
Commissioner	- .
Practitioner	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden .
Reviewer	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
Applicability	*Reviewers comment:* The data should be used with great care. The energy use for different types of ships can vary depending on e.g. size, shape of the hull, hydrodynamic properties and engine strength. This can give a very broad distribution in the energy use depending on which individual ships the energy use were based.
About Data	The emissions were calculated from the energy use and emission factors. The emission factors that were used and the basis for them can be found in general metadata.

Technical System	
Name	TDI - PUR precursors
Functional Unit	1 kg TDI
Functional Unit Explanation	
Process Type	Cradle to gate
Site	
Sector	Materials and components
Owner	
Technical system description	This set of data concerns the production of the polyurethane precursors (TDI, MDI, Polyols) and not the production of the polyurethane foam. The principal raw materials for polyurethane precursors are crude oil and natural gas. The diisocyantes having the greatest commercial importance originate from the aromatic content (benzene and toluene), while the polyols come almost exclusively from the aliphatic content. Diisocyanates are obtained by phosphogenation of daimines which are produced, via a number of intermediates steps, from aromatic hydrocarbons. The diisocyanate with the greatest technical importance are tolyene diisocyanante (TDI) and diphenylmethane diisocyanate (MDI). The polyols used in polyurethane production are predominantly hydroxy-polyesters. They are produced by alkoxylation. Depending on the degree of cross-linking required, the starting alcohols used for hydroxy-polyethers may be divalent glycols (ethylene, propylene and other glycols) or multivalent alcohols. The epoxides used are generally propylene oxide and ethylene oxide.

Intended User	APME's eco-profiles serve two
General Purpose	There is an increasing demand concerning LCA data. Following this trend, ISOPA [The European Isocyanate Producers Association] members in Western Europe wanted to provide public ''Cradle to the gate data'' concerning their product's life-cycle.
Detailed Purpose	The aim here is to provide ''cradle to gate'' data for the manufacturing of TDI
Commissioner	- ISOPA, Avenue E. van Nieuwenhuyse 4 Box 2 B 1160 Brussels.
Practitioner	Boustead, Ian Dr - .
Reviewer	
Applicability	
About Data	The transport of the different precursors to the plant where is produced polyurethane foam is not included here in this set of data. Data on the production processes have been supplied by ARCO Chemical, BASF, BAYER, DOW, Enichem, ICI, Rhone Poulenc and Shell relating to plants operating in Belgium, France Germany, Italy, the Netherlands, Portugal, Spain and the United Kingdom. Data have been obtained from plants in 1990 produced some 250000 tonnes of TDI. It is important to recognise that the data do not refer only to the final conversion stages leading to TDI but to all operations starting with raw materials in the earth-

SPINE LCI dataset: Thermal treatment of solid municipal waste

Administrative	
Finished	Y
Date Completed	2002-08-14
Copyright	McDougall F. et al, Integrated Solid Waste Management
Availability	Public

Technical System	
Name	Thermal treatment of solid municipal waste
Functional Unit	1 tonne of waste to incineration
Functional Unit Explanation	An average composition of Municipal solid waste is used here. The waste to incineration have the following compostion: 15% paper, 15% other, 10% organic, 10% film plastic, 10% ferrous material, 10% non-ferrous, 10% textile, 10% glass and 10% rigid plastic is used. (McDougall F.)
Process Type	Gate to gate
Site	Europe
Sector	Waste treatment
Owner	Europe
Technical system description	Thermal treatment of municipal solid waste is an incineration process where outputs of the process depend on the inputs, e.g. what is burned. - The process: This activity describes a mass-burn process for mixed municipal solid waste (MSW). Mixed MSW contains; paper, film plastic, rigid plastic, glass, textile, ferrous material, non-ferrous material, organics and other. The thermal treatment process, as well as liberating energy from the incoming waste, also consumes energy. This is required for operating cranes, moving grates or fluidised bed, fans for air, injectors, and emission control equipment, as well as for general heating and lighting. For Municipal solid waste incineration around 14% of the electrical power generated is consumed on-site with a specific consumption of around 70kWh/tonne incinerated (McDougall, 2001) Therefore only Natural gas is added to the process as an inflow of energy. It is assumed that recovered energy is used only to generate electricity and that electricity is exported from the system. Since boilers attached to municipal waste incinerators must operate at lower steam temperatures to reduce corrosion, incinerators producing electricity only have a conversion efficiency of around 20%. - Flue gas treatment: There are different types of gas-cleaning processes. The amounts of solid and aqueous waste generated depends on what type of process that is used. A dry-scrubbing system will generate only solid waste whereas a wet-scrubbing system will produce both solid and aqueous waste. Water emissions in this activity arise from use of wet gas-scrubbing equipment. In the model it is assumed that all water emissions are treated on-site, with only resultant sludge (called Slags and ash in the table) leaving the site. Dust from filters and sludge residues from the gas-scrubbing system are also produced. With an air pollution control removal efficiency of about 98.4 % for heavy metals, a small amount of these are emitted to the air. These emissions are presented in the output-table. Heavy metals from incineration are As, Cd, Cr, Cu, Hg, Ni, Pb and Zn. Reference: McDougall F. et al, Integrated Waste Management - a Life Cycle Inventory, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001

System Boundaries	
Nature Boundary	Emissions to air and ground from combustion of different materials in the waste are included. Emissions from natural gas combustion are not included due to lack of data. These emissions are assumed to be a small part of all emissions from the process.
Time Boundary	Study completed 1992-2001
Geographical Boundary	The aim is that the system should represent an incineration plant in Europe.
Other Boundaries	Production of natural gas used in the system is not included.
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1992-2001
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	Emission data are from McDougall, 2001 and RTI, 1997. The calculations have been made by the person responsible for this documentation; (Emission factor for each material) * tonne of material incinerated= Emission. The Emission factors are based on a model developed by US EPA, Federal Regulations (RTI, 1997) Data concerning electricity production are taken from ETSU, 1993. Data about Filter dust and Slags and ash are based on a mass-burn facility of Municipal solid waste with a Wet gas-scrubbing process according to McDougall, 2001.

Method: Energy production is based on mass burn of Municipal solid waste (MSW). In Sweden the calorific value is 7-11GJ/tonne incinerated (Svedberg, 1992). Energy Technology Support Unit (ETSU, 1993) for this model assume a gross production of 520 kWh/tonne of waste with a net calorific value of 8.0 GJ/tonne (McDougall, 2001). Incinerators producing electricity only have a	Output	Refined resource	Electricity	450			kWh	Technosphere	

conversion efficiency of 20% beacause boilers attached to municipal waste incinerators must operate at lower steam temperatures to reduce corrosion. For MSW incineration around 14% of the electrical power generated is consumed on-site with a specific consumption of around 70kWh/tonne incinerated (McDougall, 2001) This gives an electricity stream out of the system of 520-70= 450kWh/tonne waste to incineration Literature: Svedberg, Waste Incineration for Energ Recovery, Final report, 1992 ETSU, An Assessment of Mass Burn Incineration Costs, Energy Technology Support Unit, Report B.1314 by Aspinwall and co LTd, London departmant of trade and company, 1993. Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001 Notes: For Residue Derived Fuel(RDF) a calorific value of 18GJ/tonne can be assumed (McDougall, 2001)									
Method: For mass-burn of MSW a wet gas-scrubbing process result in 20-30 kg of dust/tonne waste. (McDougall, 2001) Literature: Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001	Output	Residue	Filter dust	20			kg	Ground	
Method: For mass-burn of MSW a wet gas-scrubbing process result in 2.5-12 kg of sludge residue per tonne waste incinerated (McDougall, 2001) In this model this sludge is called Slags and ash even though ash is not produced. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001	Output	Residue	Slags and ash	12			kg	Technosphere	

About Inventory

Publication	McDougall F. et al, Integrated Solid Waste Management - A Life Cycle Inventory, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001 Data documented by: Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Documentation reviewed by: Ann-Christin Pålsson, Industrial Environmental Informatics, Chalmers University of Technology Published in SPINE@CPM: 14 August 2002
Intended User	The original study this docume
General Purpose	Data about waste management systems are insufficient and more data are required by the industry.
Detailed Purpose	This documentation is based on a study about Integrated Solid Waste Management performed by Forbes McDougall et al at Procter & Gamble Technical Centres, 2001. The aims of that study was to introduce a LCI model for Integrated Waste Management and to provide data that support the concept of Integrated Waste Management as a sustainable method of managing solid waste. The purpose of the documentation of this system has been to make data for waste management available in this format for the industry.

Applicability	Most incinerators are mass-burn facilities, with an input of mixed municipal solid waste (MSW) but the input to a thermal system could also be Refuse-derived Fuel (RDF) or source-separated paper and plastic depending on the process involved. RDF is lighter materials in MSW (paper and plastic), which are separated out and shredded to produce ''floc'' or non-densified RDF (cRDF). This can then be pelletized to improve handling, producing densified RDF (dRDF). Burning RDF or paper and plastic as fuels involves a relatively consistent and well-defined input of waste. The inputs to MSW incinerators, comprising of restwaste and residues from other waste treatment processes, is much more variable. This incoming waste will vary with the waste composition, which has been shown to vary both geographical and seasonally. Flue gas cleaning processes are becoming more effective and air emissions are different at different plants. Therefore less or more inorganic pollutants can be emitted to the atmosphere. For air emissions from combustion of MSW there is an EU Directive and the maximal

	emission level for each compound within EU is presented below: Particles 150, CO 500, SOx 1500, HCl 250, HF 100, Total HC 100, Cd 0.5 g/tonne burned material. (89/369/EEC(1989) Emissions from the system described here are all below the maximum emission levels within EU. Energy production in this system is calculated for mass burn of MSW in Sweden. The calorific value for MSW in Sweden is 7-11 GJ/tonne (Svedberg, 1992) and the calorific value for RDF in Sweden can be assumed to be 11-18 GJ/tonne (Svedberg, 1992) For PPDF i.e. burning of source-separated paper and plastic as fuel, data are insufficient. Not all of the primary heat released in an incinerator can be recovered in a useful form, and the level of recovery depends on the use to which the energy is put. Since boilers attached to municipal waste incinerators must operate at lower steam temperatures to reduce corrosion, incinerators producing electricity only have a conversion efficiency of around 20%. With a gross power production of 520 kWh/ tonne of waste (Atkins, 1993) with a net calorific value of 8.0 GJ/tonne, giving a conversion efficiency of 23% for a plant of 200 000 tonnes per year capacity. Energy released during incineration may be used for several purposes, e.g. electricity generation, heat and steam production, each with its own conversion rate for the amount of useful energy produced. References: Svedberg G, Waste Incineration For Energy Recovery, Final Report, 1992. Atkins et al, Energy Technology Support Unit, An assessment of mass-burn incineration costs, 1993
About Data	Data gives a rough picture of in and outputs from a thermal treatment plant in Europe. Data are based on the study about Integrated Solid Waste Management performed by Forbes McDougall et al at Procter & Gamble Technical Centres, 2001. The descriptions of the activity is how it was understood by the person who made the documentation. It needs to be borne in mind that not all emission data sets are complete, and that incineration of mixtures may not give rise to the sum of their parts, since interactions may occur. Emission for natural gas used in the system are not accounted for. Emissions from different materials in the waste are accounted for. The data is only valid for waste with the specific composition used in this system, see functional unit explanation for further information. Data for different compositions can be found in McDougall F., Integrated Solid Waste Management. Wet gas-scrubbing results in 20-30 kg of dust and 2.5-12 kg sludge residue per tonne of municipal solid waste incinerated. Here it is assumed that 20 kg of dust and 12 kg of sludge residues from the gas-scrubbing system are produced. A small amount of heavy metals are emitted, about 98.4 % of these air pollutions are taken care of by the air pollution control in the flue gas treatment. Heavy metals from incineration are As, Cd, Cr, Cu, Hg, Ni, Pb and Zn.
Notes	For further information about solid waste managment see: Flemström K., Brief overview of solid waste management, IMI-internal report. The report may be downloaded from: http://www.imi.chalmers.se

SPINE LCI dataset: Thinning of forest area

About Inventory

Publication	None -- Data documented by: Göran Swan, Ola Svending, STORA Corporate Research Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	LCA practitioners
General Purpose	The purpose is to supply with LCA-data for forestry to be used in further studies of wood products.
Detailed Purpose	These data are an update of earlier data on the same subject. To be used in LCA representing the thinning part of forestry in central Sweden. Can also be used as an average for Sweden.
Commissioner	- Stora Corporate Research, Box 601 661 29 Säffle Sweden.
Practitioner	Swan, Göran - Stora Corporate Research, Box 601, S-661 29 Säffle, Sweden.
Reviewer	Hallonborg, Ulf - Skogforsk

Applicability	These data are valid for large scale thinning in forestry. It is important to check the type of fuel used. In this case, fossil fuel is assumed to be used. Other data is available from other forest companies, or from Skogforsk, or STFI. The silviculture process in Sweden has eight steps: 1. Plant nursing 2. Soil preparation 3. Planting 4. Clearing 5. Thinning 6. Fertilizing 7. Final felling 8. Forwarding to roadside This is the first step.

SPINE LCI dataset: Transistor assembly

Administrative	
Finished	Y
Date Completed	2000-02-28
Copyright	Ericsson
Availability	Official

Technical System	
Name	Transistor assembly
Functional Unit	One gram of transistor capsule.
Functional Unit Explanation	The motivation for choosing this functional unit is: · suitable unit to work with in an LCA of a private branch exchange (a complicated telecom product) · important component of the MD110 product system and many other electronic products. DESIGN The answers from the component manufacturer are for a transistor. These facts are based on Ericsson technical specification of the component. Ericsson product number: RYN 121 37/1 Ericsson description: Transistor, Silicon General information NPN planar epitaxial low level amplifier and switching transistor in plastic case intended for surface mounting. Dimensions: moulded plastic case, SOT-23 Weight: about 0.017 grams Height: 0.85-1.21 mm Width: 2.8-3.0 mm Length: 1.2 - 1.4 mm Leads diameter: 0.08-0.15 mm Leads width: 0.38-0.48 mm
Process Type	Gate to gate
Site	Not relevant
Sector	Manufacturing
Owner	Not relevant
Technical system description	This activity includes the final assembly of a transistor. The activity is based on information acquired from one manufacturer. The description of the process is supplied by this manufacturer, but is assumed to be general for this type of manufacture. The following process steps are included; 1. Si-crystal die bonding onto a leadframe 2. Wire bonding 3. Encapsulation, usually in an epoxy plastic

	4. Solder- or tinplating 5. Trim, form and mark 6. Testing and packing No detailed description was given by the manufacturer.

System Boundaries

Nature Boundary	The emissons to air and water have nature as recipient. Each parameter mentioned by the component manufacturer have been studied. No parameter has deliberately been disregarded when environmental impact have been studied.
Time Boundary	1997 The answer from the manufacturer arrived in 1998 and they measured in 1997. The process technology used is most certainly the best available as the factory is located in Hong Kong and the company is well established.
Geographical Boundary	The technical system for this model is limited to the factory where the production takes place. The manufacturer is located in Hong Kong.
Other Boundaries	Delimitations to the system is the final step in the making of the transistor. The production of the subparts (e.g. encapsulation, lead frame and bondwires) of the resistor is not included in this model. Also, the Si wafer production and Si wafer processing are excluded. These production steps have instead been treated as a separate activity (see activity ''Si wafer production and Si wafer processing for transistors''). The transportation of them to the factory is not included.
Allocations	The manufacturers have not described how the allocation has been made. We did not decide or have any suggestions on how the manufacturer should allocate in their factory. According to the manufacturer, the data has been obtained by plant expert.
Systems Expansions	None.

Flow Data

General Activity QMetaData

Date Conceived	1997
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	We asked three manufacturers for a transistor with capsule size SOT23. This model describe the assembly/encapsulation to the semiconductor (SOT23) device and not Si wafer production and Si wafer processing. The model shall be regardad as one of two connected models describing three main steps in the manufacturing of a transistor. We got one usable answer, here refered to as CM, and the data that are presented are based on information this component manufacturer. The information was requested using a LCI data questionnaire. However, the manufacturer instead sent a broschure contaning the requested information. The data presented here are based on this broschure.

About Inventory	
Publication	Not available --- Data documented by: Anders Andrae, Ericsson Business Networks AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology ---
Intended User	The intended use for this LCI

General Purpose	The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks. The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system. The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB. Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts. The main purpose of the study for Ericsson is; - to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and - to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the internal work with an Environmental Management System for Ericsson Enterprise Systems. Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson. The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.
Detailed Purpose	Map a transistor assembly process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the final assembly of transistors and resembling components in our telecom products. The usage for this set of data are life cycle assessments where transistors are part of the studied system. Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX. The division into component groups is based on structural resemblance, electrical function and material contents of the different components. -- Below is a list of the component groups and corresponding models that have been compiled: 1. Cables - Model: Cable assembly 2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly 3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly 4. Connectors and holders - Model: Connector assembly 5. Diodes - Model: Diode wafer production and assembly 6. Display units and indicators - Model: Liquid crystal display assembly 7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked) 8. Other - Model: ''Other'' electronic component assembly 9. Potentiometers - Model: Potentiometer assembly 10. Printed boards - Model: Printed board assembly 11. Relays - Model: Relay assembly 12. Resistor networks - Model: Resistor network assembly 13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly 14. Resistors; surface mounted devices - Model: Resistor for surface mounting assembly 15. Transformers and inductors - Model: Inductor assembly 16. Transistors and opto couplers (2 models) - Models: 1. Transistor assembly and 2. Si wafer production and Si wafer processing for transistors (these models are interlinked)
Commissioner	- Ericsson .

Applicability	This set of data can be applied to transistors in electronic equipment if you know how much the transistors weigh. The model is also intended to be representative for opto couplers. This model is one of two connected models describing three main steps in the manufacturing of a transistor. The Si wafer production and Si wafer processing for the transistor is described in a separate model; see the activity ''Si wafer production and Si wafer processing for transistors''.
About Data	The data is based on information from a company confidential brochure. The information was requested using a life cycle inventory questionnaire. The company chose to give us a brochure, instead of filling in our questionnaire but the result would have been the same. The outline of the LCI data questionnaire that were used in the inventory follows below. No limitations or specifications were set for which substances they had to account. -- LCI data questionnaire -- Transport description: Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km). We here only asked for flows exceeded 2% by weight of the material declaration of the component. Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes.´ Process description. Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gathered it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (e.g. planned changes in production rate) Material, components and natural resource input, etc. We told them to express data in amount per functional unit. Name of material, component or resource. Used amount(mg). Amount In Product(mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production site (address). Suppliers of transport (address). Additional information. Emissions. Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information. Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information. Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information. Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.

Name	Transport with a compressed natural gas bus. ESA-DBP

Functional Unit	1 bus km
Functional Unit Explanation	The bus runs in Braunschweig driving cycle (see also 'Function').
Process Type	Gate to gate
Site	Unknown
Sector	Transport
Owner	Unknown
Technical system description	The compressed natural gas bus is a quite popular mode of transport. It uses specially prepared natural gas - CNG-b. (Excerpt from the report, see 'Publication'): ''The emission data and energy used for several bus technologies have been measured at the test facilities of the Swedish Motor Vehicle Inspection Co. The Braunschweig driving cycle is used. The test inertia used for the buses was 13 ton.'' (NB: The Braunshweig driving cycle covers: duration - 1740 s, average speed - 22.9 km/h, maximum speed - 58.2 km/h, idling time 22 %, driving distance - 11km). This process is included in the system described in: Karlström M. (2002). Environmental Technology Assessment of Introducing Fuel Cell City Buses - A Case Study of Fuel Cell Buses in Göteborg. ESA report 2002:10, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2002--10.pdf Other processes in the CPM Database also included in the above publication: Hydrogen fuel production by steam reforming of natural gas. ESA-DBP Hydrogen fuel production from on-site electrolysis. ESA-DBP Transport with a fuel cell bus run on hydrogen produced in steam reforming process. ESA-DBP Transport with fuel cell bus run on hydrogen produced in electrolysis process. ESA-DBP Transport with a diesel bus. ESA-DBP

System Boundaries

Nature Boundary	In the process there are included inflows and outflows from two different activities. One of them is natural gas production (Well-to-Tank), which includes all life cycle process in the fuel pathway, from feedstock to fuel dispenser nozzle. The other one is using the bus (Tank-to-wheel) which relates to ''moving of vehicle through its driving cycle''.
Time Boundary	The data come from the year 2000.
Geographical Boundary	The buses were tested in the test facilities of the Swedish Motor Vehicle Inspection Co. (Sweden)
Other Boundaries	The Braunschweig driving cycle is used. (NB: The Braunshweig driving cycle covers: duration - 1740 s, average speed - 22.9 km/h, maximum speed - 58.2 km/h, idling time 22 %, driving distance - 11km). The fuel is compressed natural gas - CNG-b.
Allocations	Data were given for 1 bus km.
Systems Expansions	Not applicable.

Intended User	LCA practitioner
General Purpose	Excerpt from the report, see ' Publication': ''The main goal is an environmental assessment of the use of fuel cell buses on bus route 60 in Göteborg. Environmental assessments involve the gathering, evaluation and synthesize of data and methods using engineering and scientific research to help address an environmental decision making situation. This assessment is made to decide whether to invest in a new technology for fuel cell buses by 2006 or to rely on other bus technologies. (...) The main goal is divided into 3 parts. the first goal of this study is to describe the technical system, methodology used, and frame of the problem. In the future when real investment decision will be made, this study could then help frame an actual investment decision. The second goal is to present environmental performance results for the different alternative bus technologies. The results address emissions, health effects, and financial investments. The third goal is to describe and assess the uncertainties of the results.
Detailed Purpose	A transport with a compressed natural gas bus was compared to the transport with the fuel cell bus which was a main object of the study.

Technical System	
Name	Transport with a fuel cell bus run on hydrogen produced in electrolysis process. ESA-DBP
Functional Unit	1 bus km
Functional Unit Explanation	The flow data are given per 1 km which the fuel cell bus will run. The bus weighs 18900 kg.
Process Type	Gate to gate
Site	Volvo, Sweden
Sector	Transport
Owner	Volvo, Sweden
Technical system description	The fuel cell buses can run using hydrogen as a fuel. For this study simulation from Volvo was used as a reference. In the study it was assumed that the route of the bus includes (excerpt from the report, see 'Publiation'): ''starting capability on a steep slope, acceleration, maximum speed and uphill speed holding at normal speed. The fuel cell bus powertrain used has a minimum battery and hydrogen storage and no reformer. The weight of the fuel cell bus is 18,900 kg and the nominal power of the electrical machine is 250kW.'' This process is included in the system described in: Karlström M. (2002). Environmental Technology Assessment of Introducing Fuel Cell City Buses - A Case Study of Fuel Cell Buses in Göteborg. ESA report 2002:10, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. SPINE LCI dataset: Transportation of crude oil to Sweden

Administrative	
Finished	Y
Date Completed	1996
Copyright	KFB
Availability	Public

Technical System	
Name	Transportation of crude oil to Sweden
Functional Unit	1 MJ
Functional Unit Explanation	The environmental load for transporting 1 MJ crude oil to Sweden
Process Type	Gate to gate
Site	Transportation of crude oil from different parts of the world to Sweden.
Sector	Transport
Owner	Transportation of crude oil from different parts of the world to Sweden.
Technical system description	The system accounts for the transportation of raw oil to Sweden. Also the unloading of the crude oil is accounted for. Crude oil is transported from different parts of the world to refineries in Sweden.

	49% of the total amount crude oil imported to Sweden comes from Norway. All oil coming from Norway is off shore produced crude oil. The rest of the crude oil comes from the following countries in the following amounts: Iran 11%, Lettland 8%, Venezuela 8%, South Arabia 6%, Denmark 6%, Egypt 6%, Nigeria 3% and other countries 3% (According to the Swedish Shipping Association 1996). The crude oil is transported to Sweden by high sea tankers (280 000 ton d.w5) from the Persian golf and Venezuela, ''Norway tankers'' (120 000 ton d.w5) from Norway and coast tankers (20 000 ton d.w5) from the remaining countries.

System Boundaries

Nature Boundary	Emissions to air and energy use are accounted for.
Time Boundary	The data describes the situation for 1996. War, natural disasters, new crude oil findings and such things can change the import situation for Sweden, and therefore the data will get inaccurate.
Geographical Boundary	The world
Other Boundaries	The system accounts for the transportation of 1MJ raw oil to Sweden. Also the unloading of the crude oil is accounted for in the table.
Allocations	
Systems Expansions

General Activity QMetaData

Date Conceived	1996
Data Type	Derived, unspecified
Represents	See 'Function'
Method	literature study of Life cycle analysis of fuel, 1996, Blinge Magnus, Aranäs Per-Olof, Bäckström Sebastian, Furnander Åsa, Transportation and logistics, Chalmers University of Technology, KFB-Meddelande1997-5, where the following has been done. The use of energy and emissions due to the transportation is calculated from the total transporting load for the different types of tankers and their routs. The emissions and the energy consumption have been calculated due to the following average distances between the different countries and Sweden: Norway to Sweden 1000 km Back to Norway 1000 km Persian Golf (Abadan) to Sweden 21870 km Back to Persian Golf 13060 Venezuela + Nigeria (Puerto Cabello) to Sweden 8419 km Back to Venezuela + Nigeria 8419 km Latvia to Sweden 400 km Back to Latvia 400 km Denmark + Europe to Sweden 500 km Back to Denmark + Europe 500 km The following emissions are used in the calculations for the different types of boats: Coast tanker: CO2 12,5 g/ tonn and km, CO 0,0187 g/tonn and km, NOx 0,26 g/tonn and km, NMHC 0,0037 g/tonn and km, SO2 0,206 g/tonn and km, Susp solid 0,0075 g/tonn and km. High sea tanker: CO2 3,9 g/ tonn and km, CO 0,0013 g/tonn and km, NOx 0,12 g/tonn and km, NMHC 0,0052 g/tonn and km, SO2 0,097 g/tonn and km, Susp solid 0,0058 g/tonn and km. Norway tanker: CO2 5,5 g/ tonn and km, CO 0,0017 g/tonn and km, NOx 0,15 g/tonn and km, NMHC 0,0066 g/tonn and km, SO2 0,151 g/tonn and km, Susp solid 0,0074 g/tonn and km. The ships are assumed to be carrying full cargo to Sweden and no cargo from Sweden. All figures come from the Swedish Shipping association
Literature Reference	Life cycle analysis of fuel, 1996, Blinge Magnus, Aranäs Per-Olof, Bäckström Sebastian, Furnander Åsa, Transportation and logistics, Chalmers University of Technology, KFB-Meddelande1997-5.
Notes	The data corresponds to the emissions caused by the transportation of 1 MJ crude oil from different places in the world to Sweden. The energy used in the process is also accounted for.

Applicability	
About Data	Depending on the type of vehicle that is being used, the chosen route and so on the emissions differ, but no consideration has been made concerning these changes. When working with the report ''Life cycle analysis of fuel'' some errors in the documentation was found. Through a dialog with one of the authors (Blinge Magnus) the matter has been resolved, so that the values and information in SPINE should be correct. In the report, ''Life cycle analysis of fuel'', table 13-4 and B7-4 shows the figures for the environmental load for shipping crude oil to Sweden, when the distance between the Norwegian oil fields and the Swedish refineries has been assumed to be 700 km. The authors of the report thought that this figure was to small and therefore they changed it to 1000 km but not in all the places in the report. In enclosure 3 on line 122 the correct information can be found.

Technical System	
Name	Transportation with diesel driven waste collection vehicle. ESA-DBP
Functional Unit	1 km of transportation
Functional Unit Explanation	1 kilometer of transportation on a typical waste collection route.
Process Type	Unit operation
Site	Gothenburg, Sweden
Sector	Land transport
Owner	Gothenburg, Sweden
Technical system description	Fuel demand and emissions during transportation with a diesel driven waste collection vehicle. Excerpt from the report (for report see link below): ''3.3 Use of the vehicle 3.3.1 Description of a typical waste collection route In the inventory description of the use phase the waste collection route is divided into three ''sub phases'', illustrated in Figure 8. Driving the vehicle from the garage to a waste collection area, between waste collection areas, to the incineration plant and back to the garage is in this report labelled transportation. Within a waste collection area the vehicle drives short distances between sites where waste is collected. This collection area driving is separated from the transportation to and from collection areas because it is another type of driving, generally much slower and with more acceleration and braking, which leads to other exhaust emissions. At the collection stops, waste bins are collected, the waste is loaded into the vehicle and it is then compacted. A conventional vehicle keeps the engine running at the stops, idling when the workers collect waste bins and working when loading and compacting waste. In a hybrid vehicle the engine is turned off 30 seconds after it has stopped, and the electric motor is then used for loading and compacting. Sometimes the loading and compacting procedure is carried through only once at a stop and sometimes a couple of times. After having collected all waste in one collection area, it might continue to another one, located some distance away, such as another city district. When the waste container of

	the vehicle is full, it is taken to the incineration plant, where it is emptied. Then it might go back to the garage or to another waste collection area to continue collecting waste.'' NB: Figure 8 in the text above is figure 8 at page 22 in the report. This process is included in the system described in ''Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. Environmental Systems Analysis report 2005:7, Chalmers University of Technology, Gothenburg, Sweden'' at http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--7.pdf Other processes in the CPM Database also included in the above publication: Truck chassi manufacturing. Intended User	LCA practitioners.
General Purpose	Process data in a Master Thesis Report.

Detailed Purpose	This process data set is a part of the comparative LCA for 'Gas-Electric Hybrid Waste Collection Vehicle'.
Commissioner	Renova AB - .
Practitioner	Anna Boss - .
Reviewer	Carl Jensen, Renova AB and Karin Andersson, Chalmers -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries'.
About Data	Excerpts from the report (for report see link in 'Publication'): ''For evaluation of a gas vehicle, measurements from the hybrid vehicle with the engine kept running at the stops were used. The values were also adjusted according to weight differences due to the extra hybrid electric equipment. The reason for not using data directly from a gas vehicle is because the gas vehicles Renova has is of an older model and have another engine type.'' ''Another important note is that the hybrid vehicle uses a catalytic converter that reduces methane emissions by 80 percent and the diesel vehicle uses a ''CRT particle filter'', which reduces emissions of particles, NOx and CO (Jensen, personal communication). The diesel vehicle fulfils the Euro 3 emission standards.'' ''Measurements were carried out during the different phases related to waste collection. While driving the vehicle at approximately constant speed, 50 km/h, transportation to and from a waste collection area was simulated. Waste collection within a collection area was simulated in a track where driving for 30 seconds followed by a 2 minutes 30 seconds stop for collection, loading and compacting. There are also measurements for idling and loading/compacting separated from the collection track. The measurements for transportation (to and from a collection area) are related to distance and the measurements for collection area driving and collection stop are related to time.'' ''To sum up, the times and distances are: Collection stop time: 1573 seconds/ton Collection area driving time: 503 seconds/ton Transportation distance, conventional vehicle: 4.67 km/ton Transportation distance, hybrid vehicle: 4.77 km/ton'' ''Emissions and resource use during electricity production were calculated using data for average Swedish electricity production (see section 3.1.2).'' NB: Section 3.1.2 is a section in the report. ''Other energy carriers used include diesel, natural gas and fuel oil. Data about production of these were found in a study of production and use of several fuels (Uppenberg et al., 1999). Use of crude oil/natural gas as resource was not included in Uppenberg et al. Instead these resources used were assumed to be of the same amount as the fuel used (1 kg of crude oil for the use of 1 kg of fuel oil or diesel and 1 kg of natural gas for the use of 1 kg of natural gas as fuel). For a few processes, combustion of fuels (fuel oil, diesel and liquefied petroleum gas - LPG) was added using data from the energy and transport database included in LCAiT (CIT Ekologik, 2003). Also data for the production of LPG was taken from this database. Facts from Uppenberg et al. were also used to recalculate fuel amount between units of mass, volume and energy content.'' NB: Complete references to Uppenberg et al. (1999) and CIT Ekologik (2003) can be found in the report. ____ ESA Database Project. Years: 2009-2011. SPINE LCI dataset: Treatment of waste oil from industries and municipalities

Administrative	
Finished	Y
Date Completed	1999-04-15
Copyright	
Availability	Public

Technical System	
Name	Treatment of waste oil from industries and municipalities
Functional Unit	1 m3 of treated oil

Functional Unit Explanation	The choice of functional unit is based on that the oil treatment at Reci Göteborg is seen as a part of the system converting waste oil into fuel oil.
Process Type	Gate to gate
Site	Reci Industri AB Box 48047 418 21 Göteborg
Sector	Waste treatment
Owner	Reci Industri AB Box 48047 418 21 Göteborg
Technical system description	Waste-oil treatment The facility treats both waste-oil, lubricating oil and fat. Lubrication oil and fat undergoes the same treatment as waste-oil. The oil is delivered by sludge-suction-truck to special receiving tanks, where it is analysed and controlled on among other things the PCB-contents. Waste-oil delivered in oil drums are emptied by sludge-suction-truck to the reception tanks and are controlled in the same way. After approved analysis the waste-oil is pumped via a rotating strainer where oil, water and particles are separated. The oil-contaminated water is pumped to the water treatment facility and the solid particles are transported to Sävenäs, a waste fuelled power plant. The oil is, after the filtering, sent to a number of processing tanks, i.e. settling tanks. The process of separation into oil and water is speeded by heating the oil waste to 60ºC. The oil phase is derived from the top through swivel arrangement and is, after further filtering, stored in storing tanks. Oil-sludge, caused by sedimentation in the oil tanks, is derived when the tanks are cleansed with Autosafe 3000 and transported to SAKAB. The treated oil leaves the plant by boat for further processing at Reci's facility in Halmstad. The transportations are not considered in this system.

System Boundaries

Nature Boundary	Resources that are not seen as limited in Sweden are neglected e.g. land usage and fresh water. The electricity utilised by the system is only seen as a resource and the origin is not interpreted.
Time Boundary	The study only deals with retrospective data from and no attempts are made to predict future events or conditions. 1997 is assumed as a suitable time frame to collect and interpret data.
Geographical Boundary	The geographical boundary for the tretment of waste-oil is set to Sweden.
Other Boundaries	The input resource, Autosafe 3000, is emitted through the oil-sludge. As the oil-sludge leaves the facility for combustion at SAKAB its impact on the environment can't be calculated at Reci Göteborg. The emission caused by Autosafe must though be taken under consideration when the sludge is combusted at SAKAB, and depends on the process at this facility. The pollutants in the wastewater are not represented here. The wastewater is sent to the water treatment facility. As the facility is seen as a subsystem to the oil treatment, emissions caused by the wastewater are included there. No spill occurs in the plants. The loading and unloading step is neglected in terms of consuming resources or emitting outputs. The environmental impact from capital goods and activities serving the process are neglected e.g. personell, infrastructure and facilities. Moreover, maintenance and wear down of the system are neglected.
Allocations	According to the functional unit only the resource use and emissions from treatment of the waste-oil are of interest, therefore are only those impacts accounted for. The waste-oil is supposed to contain 30 % water. Fat and lubricating oil are supposed to demand the same resource use per m3 as waste-oil. The electricity demand for oil treatment is estimated to 85 % of the total use for the facility (Lars Schaff, environmental manager Reci Industri Göteborg). The oil contamination of the water in the surface water system is supposed to be caused exclusively by the oil treatment process. Measurements on the amount of water in the system was performed during the period January-September. Since this is the only available data it is assumed to represent the total amount of water generated in the system.

Date concieved: 1997 Data type: Economical information Method: Total amount used 1,75 m3. Literature: Environmental report Skarvik 1997 Notes: The degreasing agent, Autosafe 3000, is emitted through the oil sludge. Product information Autosafe 3000 Company of distribution: Lahega Kemi AB Box 10073 25013 Helsingborg phone: +46 -42 201700 Product composition: Natriummetasilikat 1-5% 2-Aminoctanol 5-15% Noniontensider <5% Dipropionat <5% Water	Input	Refined resource	Degreasing agents	0.0002			m3	Technosphere	Sweden
Date concieved: 1997 Data type: Economical information Method: The total use of electricity for Skarvik was 2.2 GWh. The waste oil treatment is considered to demand 85% of the total use. Literature: Environmental report for Skarvik of 1997 Notes: The electricity is delivered by Göteborgs Energi.	Input	Refined resource	Electricity	197.88			kWh	Technosphere	Sweden
Date concieved: 1997 Data type: Monitored data, discrete Method: Delivering sludge-suction-trucks are weighted to determin the amount of recieved waste-oil. Literature: Environmental report for Skarvik of 1997. Dennis Göthe, process engineer at the water treatment facility (Ciclean). Christian Arte´n, process engineer at Skarvik Notes: The inflow of waste oil was totally 22 436 tonnes during 1997. The composition was as follows: Waste oil 19 326 tonnes Lubrication oil 3 017 tonnes Lubrication fat 93 tonnes Lubrication- oil and fat are considered to have the same resource use and emissions per ton as waste-oil.	Input	Refined resource	Waste oil	2.374			tonne	Technosphere	Sweden
Date concieved: 1997 Data type: Unspecified, expert outspoke Method: The emission is estimated to about 5 ton/year based on the pressure in the oil cisterns. Literature: Mati Hell, innovation engineer at Reci Göteborg. Notes: Emission to the air from the oil tanks. When light fraction products are delivered they are gathered in a special tank that is not ventilated to the air. 5 tonnes of hydrocarbons are emitted to the air by tank breathing.	Output	Emission	HC	529.1			g	Air	Sweden
Date concieved: 1997 Data type: Economical information Method: The amount of treated oil is measured when loaded to vessel for transportation to Reci Halmstad. Total amount of treated oil produced during 1997 was 9450 m3. Literature: Environmental report Skarvik 1997. Christian Artén process engineer Skarvik, Reci Göteborg. Notes: Functional unit. The oil is transported to Reci Halmstad for further treatment.	Output	Product	Treated oil	1			m3	Technosphere	Sweden
Date concieved: 1997 Data type: Monitored data, discrete Method: Based on an arithmetically average the outflow of water was approximately 942 m3/month. The minimum value was 555 m3/month and the maximum value 1363 m3/month. The total outflow during 1997 was 13 752 m3. (Environmental	Output	Residue	Oil-contaminated waste water	1.455			m3	Technosphere	Sweden

report). The outflow is measured as the water is pumped to Ciclean, the water treatment facility.(Lars Schaff) Literature: The environmental report for Skarvik, Reci Göteborg of 1997. Christian Artén process engineer, Skarvik Reci Göteborg. Lars Schaff environmental manager Reci Göteborg. Notes: The water phase from the settling tanks is gathered in a special tank (Christian Artén) where it is controlled with respect to the amounts of COD, mineral oil and TEX. The specimens are gathered monthly and every day one specimen is added and mixed with the previously taken specimens that month. Controlled water is pumped to Ciclean to be treated. (Environmental report)									
Date concieved: 1997 Data type: Calculated Represents: Reci Industri AB Halmstad. Method: Inquiry with the manager at Reci Halmstad, Bengt Borg. The treated waste oil is supposed to cause a sedimentation of 0,25%/m3 at Reci´s facility in Halmstad. The data is supposed to be representative for the sedimentation in Skarvik as well, calculated on the amount of treated oil. Literature: Bengt Borg production manager at Reci Industri Halmstad Notes: The oil sludge, caused by sedimentation in the tanks, is derived when the tanks are cleansed. As this is not an every-year-procedure the amount sedimentated per cubic metre is estimated as above. The oil sludge is transported to SAKAB for destruction.	Output	Residue	Oil-sludge	0.0025			m3	Technosphere	Sweden
Date concieved: 1997 Data type: Unspecified, expert outspoke Method: Inquiry to Christian Artén process engineer, Skarvik Reci Göteborg. Literature: Christian Artén process engineer Skarvik Notes: Derived scrap from filtering. The scrap is transported to Sävenäs, a waste fuelled power plant.	Output	Residue	Scrap	0.0159			tonne	Technosphere	Sweden
Date concieved: 1997 Data type: Monitored data, discrete Method: Based on an arithmetically average from 6 measurements the outflow of water was approximately 122 m3/month. The minimum value was 0 m3/month and the maximum value 282 m3/month. The total outflow during 1997 was 1101 m3 (refers to the total outflow during january-september). (Environmental report) Literature: Environmental report Skarvik of 1997 Notes: The water phase from the surface water system is gathered in a special tank where it is controlled with respect to the amounts of COD, mineral oil and TEX. Controlled water is, among with other oil-contaminated water, pumped to Ciclean to be treated. The pollution of the surface water is supposed to be caused exclusively by the treating of waste oil.	Output	Residue	Surface water	0.116			m3	Technosphere	Sweden

About Inventory

Publication	Master thesis: ''LCA on converted fuel oil'' by Daniel Strandberg and Christer Wik, MSc students Technical environmental planning, Chalmers Univeristy of Technology -- Data documented by: Daniel Strandberg and Christer Wik, MSc students, Technical Environmental Planning, Chalmers University of Technology Documentation reviewed and classified by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	Internal use at Reci Industri

General Purpose	The objective of this study was to carry out a Life Cycle Assessment for converted fuel oil. The analysis involves outlining the environmental hazardous steps in the production. The result will be used internally to aid as an environmental improving guidance as well as to receive a better view of the process. Externally the result is a part of Reci's ISO 14000 certification, which acts as a guarantee to the customers. The quality of the inquiry is set due to the standards of a Master of Science thesis.
Detailed Purpose	To estimate the resource use and emissions released from treatment of waste-oil.
Commissioner	Schaff, Lars, environmental manager - Reci Industri AB Box 48047 418 21 Göteborg Sweden.
Practitioner	Strandberg, Daniel and Christer Wik - MSc students Technical Environmental Planning Chalmers University of Technology 41296 Göteborg Sweden.
Reviewer	Beckman, Torsten - Technical environmental planning Chalmers University of Technology 412 96 Göteborg Sweden
Applicability	The data are site-specific for treatment of waste-oil. As some of the data is allocated and some are achieved through estimations and coarse measurements the result should be seen as an estimation of the emissions.
About Data	Mass balance Total in about 22436 m3 Total output about 19994 m3 Difference: 2442 m3 When calculating the mass balance 1 ton was supposed to be equivalent with 1 m3, which can explain some of the difference. When put into perspective of the total inflow the difference can be assumed to be a measurement error. As the treatment of waste-oil is a continual process and flows are only measured when entering or leaving the system it is also plausible that a significant volume was still in the system when inflows and outflows where reported. The most likely explanation is a measurement error on the outflow of water or that accumulated water where not pumped to Ciclean when finishing the report. The total outflow of water was 11 310 m3. To achieve mass balance the outflow is supposed to be 2442 m3 higher.
Notes	The reviewer acted as supervisor for the Master thesis: ''LCA on converted fuel oil'' Reci's plant at the harbour of Skarvik receives and treats hazardous waste from industries and municipalities in the western parts of Sweden. The company is part of Scancem Energy and Recovery Ltd (former Cementa Miljöteknik AB). The plant also works as a bussing station for the resource- and contribution emergency-service concerning clearing at oil- and chemical-accidents in the region. The main activity at the plant concerns pre-treatment of waste oil, emulsions and cutting fluids before sending the derived oil to Reci Halmstad for final treatment.

Technical System	
Name	Treatment of hazardous waste
Functional Unit	1 m3 of oil-sludge
Functional Unit Explanation	Oil-sludge delivered from Reci Industri AB. Waste product, origins when the oil cisterns are cleansed. Oil-sludge is delivered to SAKAB by truck from: Reci Halmstad about 237 m3 Reci Göteborg oil treatment 24 m3 Reci Göteborg water treatment facility 12 m3 The oil-sludge mainly consists of water, sediment and a smaller amount of oil. The oil-sludge also contains de-greasing agents used when the tanks are cleansed from oil-sludge. The total amount used is not known. With the assumption that the agent is petroleum based it contains to 97 per cent of hydrocarbons and 3 per cent surfactants.
Process Type	Gate to grave
Site	SAKAB Box 904 69229 Kumla Sweden
Sector	Waste treatment

Owner	SAKAB Box 904 69229 Kumla Sweden
Technical system description	SAKAB is located in Norrtorp near Kumla. The company is assigned by the Swedish government to treat environmental hazardous wastes from industries and municipalities. The treatment procedure is to burn the hazardous substances. Waste arrives by sludge-suction-truck, in barrels and a smaller part by train. The substances are stored and later mixed with other substances for supplying the kiln with an evenly mixed fuel. Heat and electrical energy is extracted from the waste when burned. The combustion process The facility is dimensioned for combustion of about 33.000 tonnes per year. Feeding of waste into the kiln is done via the front wall. In the front wall there is also an intake for primary air. The temperature in the kiln is at least 1200°. The heat in the kiln causes the slag that is formed to melt. Most of the heavy metals are made insoluble in the slag by adding of quartz. The slag-melt is derived from the bottom of the afterburner to a slag-distinguish-basin. The slag is then transported in containers to the deposit-site. From the kiln the vapour is lead to the afterburner where secondary and tertiary air is added for complete combustion. The temperature in the afterburner is regulated by fuel oil. The vapour then passes the emission steam furnace where a part of the vapour heat is used for steam production. The generated steam is used for production of electricity and for heating by Kumlas district heating. From the furnace, with a capacity of 20 MW, it is possible to derive 15 MW in heat and electricity. The fumes are then send through a smoke purifier. The process involves mixing the fumes with lime. HCl, HF and SOx react with the lime and the water evaporates. The dry product from the reaction is derived at the bottom and by a following filter. The filter has a layer of lime and active coal that contributes to further deriving of pollution. The purified fumes are led to the chimney. The emissions are difficult to estimate, as the combustion is inhomogeneous. Moreover is the fuel of various compositions. Though a calculation of the sulphur reduction has been made. The sulphur is reduced by 80 per cent, calculated generally for all wastes. Heavy metals are supposed to end up in the slag. Metals with a lower vapour point 1000°C will leave with the fumes, the major part of these metals is supposed to end up in the ashes derived from the kiln and the smoke purifier. A smaller amount of pollutant can be emitted trough the chimney suspended in water particles. The ash and slag are deposited locally at SAKAB.

System Boundaries	
Nature Boundary	Resources that are not seen as limited in Sweden are neglected e.g. land usage and fresh water. The electricity utilised by the system is only seen as a resource and the origin is not interpreted.
Time Boundary	The study only deals with retrospective data and no attempts are made to predict future events or conditions. 1997 is assumed as a suitable time frame to collect and interpret data.
Geographical Boundary	The geographical boundary is set to Sweden.
Other Boundaries	The environmental impact from capital goods and activities serving the process are neglected e.g. personell, infrastructure and facilities. Moreover, maintenance and wear down of the system are neglected. All chlorine and metals are supposed to end up in either the slag or the ashes. The sediment in the oil-sludge is not considered since the amount is unknown.
Allocations	Only the impact made by the combustion of oil-sludge is of interest. It is today impossible to say what emission origin from what specific waste. As oil-sludge mainly consists of sediment and water it is supposed to contribute very little to the emissions from SAKAB. Its contribution will be calculated from the data presented by Reci for the contents of oil-sludge. Due to uncertainty about the process, the use of quartz is not loaded upon the oil-sludge. A smaller amount of quartz is though supposed to be used by the oil-sludge.

Method	The data collected are secondary. The general decription of the plant is taken from the environmental report of 1997 for SAKAB. The information about reduction of emissions and energy calculations are achieved through interviews with Karl-Johan lötgren, process engineer and nils lovang, information manager at SAKAB. Emission data are taken from the SPINE report ''Combustion of oil'' The calculations are based on data about the oil-sludge from an analyse in 1991 achieved at Reci Industri Halmstad. The subtances are divided with the amount of treated waste to represent the amount per functional unit.

Date concieved: 1997 Data type: Calculated Method: According to the SPINE report ''Combustion of oil'' 0,013 g / MJ CO are emitted. Oil-sludge: Amount 277 m3 Oil content 18 MJ / m3 CO emission: 0,013*277*18 = 64,18 g Literature: Analyse information from 1991 on oil-sludge achieved from Reci Industri Halmstad. SPINE report ''Combustion of oil''	Output	Emission	CO	0.234			g	Air	Sweden
Date concieved: 1997 Data type: Calculated Method: Based on calculation performed for the substance Lime, see above. CO2 emission from sulphur reduction: 0,6875 kg / kg S S reduced 16 kg / m3. Amount oil-sludge 277 m3 0,6875*16*277 = 3047 kg. CO2 emission from chlorine reduction: 0,6197 kg / kg Cl Cl reduced 4,1 kg / m3 0,6197*4,1*277 = 703,8 kg CO2 emission from combustion of oil according to the SPINE report ''Combustion of oil'' 75,8 g/MJ Oil content 18 MJ / m3 0,0758*18*277 = 377,94 kg Total amount of emitted CO2 = 4128,74 kg. Literature: Analyse information from 1991 on oil-sludge achieved from Reci Industri Halmstad. SPINE report ''Combustion of oil''	Output	Emission	CO2	14905			g	Air	Sweden
Date concieved: 1997 Data type: Calculated Method: According to the SPINE report ''Combustion of oil'' 0,010 g / MJ HC are emitted. Oil-sludge: Amount 277 m3 Energy content 15 MJ / m3 Amount emitted HC: 0,010*277*18 = 49,86 g Literature: Analyse information from 1991 on oil-sludge achieved from Reci Industri Halmstad. SPINE report ''Combustion of oil''	Output	Emission	HC	0.18			g	Air	Sweden
Date concieved: 1997 Data type: Calculated Method: According to the SPINE report ''Combustion of oil'' 0,15 g/MJ NOx is emitted. Amount Oil-sludge 277 m3 Oil content 18 MJ/ m3 Amount of NOx: 0.15*18*277 = 747,9 g Literature: SPINE report ''Combustion of oil''	Output	Emission	NOx	2.7			g	Air	Sweden
Date concieved: 1997 Data type: Calculated Method: According to the SPINE report ''Combustion of oil'' 0,030 g / MJ particles are emitted. Oil-sludge: Amount 277 m3 Energy content 18 MJ / m3 Amount emitted ashes: 0,030*277*18 = 149,58 g Literature: Analyse information from 1991 on oil-sludge achieved from Reci Industri Halmstad. SPINE report ''Combustion of oil''	Output	Emission	Particles	0.54			g	Air	Sweden
Date concieved: 1997 Data type: Calculated Method: The sulphur content is 2-weight per cent in the oil-sludge. The density is approximated to 1000 kg / m3 because of the high water contents. (Reci) The emission is calculated to be reduced by 80 per cent and the emitted sulphur (20%) leaves as SO2. This gives an emission of SO2 by 8 kg/m3. (Lovang) 2%*1000*20%*(32+2*16)/32 = 8 kg/m3 Total amount SO2 emitted: 8*277 = 2216 kg. Literature: Analyse information from 1991 on oil-sludge achieved from Reci Industri Halmstad. Nils Lovang information manager SAKAB.	Output	Emission	SO2	8000			g	Air	Sweden
Date concieved: 1997 Data type: Calculated Method: The oil-sludge is supposed to generate 15,6 MJ/m3 during combustion. (Reci) 1 MJ = 1000/3600 kWh. The furnace has a capacity of 20 MJ and its possible to derive 15 MJ energy from the process. (Lötgren) This gives an energy production of 3,25 kWh/m3. Literature: Karl-Johan Lötgren process engineer SAKAB. Analyse information	Output	Product	Electricity/Heat	3.25			kWh	Technosphere	Sweden

from 1991 on oil-sludge achieved from Reci Industri Halmstad.									
Date concieved: 1997 Data type: Calculated Method: Calculated based on the sulphur and chlorine reduction. Amount of CaCl2 per kg reduced Cl = 1,5633 kg Amount of CaSO4 per kg reduced S = 2,125 kg Amount of slag: 277*4,1*1,5633+277*16*2,125 = 11 193,44 kg.	Output	Residue	Slag/Ashes	40.41			kg	Technosphere	Sweden

About Inventory

Publication	Master thesis: ''LCA on converted fuel oil'' by Daniel Strandberg and Christer Wik, MSc students Technical environmental planning, Chalmers Univeristy of Technology -- Data documented by: Daniel Strandberg and Christer Wik, MSc students, Technical Environmental Planning, Chalmers University of Technology Documentation reviewed and classified by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	Internal use at Reci Industri
General Purpose	The objective of this study was to carry out a Life Cycle Assessment for converted fuel oil. The analysis involves outlining the environmental hazardous steps in the production. The result will be used internally to aid as an environmental improving guidance as well as to receive a better view of the process. Externally the result is a part of Reci's ISO 14000 certification, which acts as a guarantee to the customers. The quality of the inquiry is set due to the standards of a Master of Science thesis.
Detailed Purpose	To estimate the resource use and emissions from combustion of oil-sludge at SAKAB.
Commissioner	Schaff, Lars, environmental manager - Reci Industri AB Box 48047 418 21 Göteborg Sweden.
Practitioner	Strandberg, Daniel and Christer Wik - MSc students Technical Environmental Planning Chalmers University of Technology 41296 Göteborg Sweden.
Reviewer	Beckman, Torsten - Technical environmental planning Chalmers University of Technology 412 96 Göteborg Sweden
Applicability	The data are specific for treatment of oil-sludge from Reci Industri at SAKAB.
About Data	Emissions are calculated based on data about the oil-sludge's contents. The data is received from analysing the oil-sludge at Reci Halmstad AB. The emissions represented in the environmental report is allocated to the other wastes. · The oil-sludge also contains de-greasing agent, which is used when deriving the sludge from the cisterns. The hydrocarbons in the agent are supposed to be comparable with the oil in the oil-sludge, surfactants and other eventual contents are supposed to end up in the slag or ashes and are not taken under consideration. As the amount slag and ashes formed by the oil-sludge is unknown it is calculated based on the sulphur and chlorine reduction. In reality the oil-sludge uses some active coal, quartz and surely reacts with elements in the other wastes but this is not taken under consideration. No massbalance has been calculated since the exact resource use and emissions are not known. the result is based on the calculation approaches stated above and are believed to accomplish a good estimation of the process.

Process Type	Gate to gate
Site	AB GRAAB KEMI Box 4047 4121 Göteborg Sweden
Sector	Waste treatment
Owner	AB GRAAB KEMI Box 4047 4121 Göteborg Sweden
Technical system description	The GRAAB-KEMI plant at the harbour of Skarvik receives and treats hazardous waste from industries and municipalities from the western parts of Sweden. The company is part of the Euroc Recycling AB (former Cementa Miljöteknik AB). The plant also works as a bussing station for the resource- and contribution emergency service concerning clearing at oil and chemicals accidents in the region. The main treatment at the plant conserns reprocessing of waste oil, treatment of emulsions and cutting fluids and liquid chemical treatment of acid, alkaline and heavy metal containing waste fluids. The cleaning plants Oil containing water from the oil reception plant is pre-treated in a separator (type centrifuge) and is gathered together with other oil containing surface water from oil-contaminated surfaces in a separate tank, before it is pumped to Ciclean for final cleaning. Used cutting fluids and emulsions are treated in a experimental plant by means of evaporation. The thickened oil phase (the concentrate) is destroyed at SAKAB. The water phase (the condense) is cleaned through two polymere filters connected in series and finaly through a charcoal filter. After this the water is led to Ciclean together with all the oil-contaminated water. At liquid chemical treatment the heavy metals are seperated as hydroxide sludge. After chamber filter pressing the rejected water is stored in tanks for analysis, before it is let out into the surface water net of Göteborgs Hamn. A more detailed description of the treatment of the waste folows below: Waste oil The oil is delivered by sludge-suction-car in special delivery tanks to be analysed and controlled on among other things the PCB-contents. After approved analysis the waste oil can via a rotating strainer be pumped to a number of processing tanks. The process of separation into oil and water is speeded by heating the oil waste to 60 deg C. The oil phase is taken out from the top through swivel arrangement and is stored in storing tanks to be transported by boat or car to an approved external combustion or treatment plant. If the oil is delivered in barrels it is emptied by sludge-suction-car to a delivery tank like above and is controlled in the same way. Lubricating oil Lubricating oil with low water content is edmitted and stored after PCB-control and mechanical straining in separate tanks. The oil is transported to external permitted plants as above. Oil-contaminated water Oil-contaminated water from the plant, flushing areas included, is gathered via pumping pit into a scrap-tank, from where it is pumped to Ciclean to be treated. Separation of oil-contaminated water from processing tanks and flushing areas has started. Used cutting fluids and emulsions Used cutting fluids and emulsions are treated in an experimental plant by means of evaporation. From this process you get one thicker oil phase, which is transported to SAKAB for destruction, and one water phase, which after among others cleaning by charcoal filter is taken to Ciclean for final treatment. Liquid chemical treatment Acid, Alkaline and heavy metal containing waste The waste arrives to the plant in bulks, by sludge-suction-cars as well as in barrels and smaller packings and is transferred to special storage tanks. The treatment is done batch by batch in a reactor, where different processing chemicals are added. When the process is done and the substance cooled it is pumped to a tank for temporary storage. From this tank the liquid is led into a chamber-filter-press, where the water is removed and a solid filter-cake is made. The water from the press is gathered in a tank and is let out into the surface water net, after it has been controlled. The solid, dry filter-cake is transported to Torsviken to be dumped. Mercury containing waste Mercury containing COD-waste from laboratories is treated in the chemical liquid plant. Dewatered mercury containing filter sludge is sent to SAKAB to be dumped. Other mercury containing waste is temporary stored, at a special place, to later on be transported to external certified recycling or dumping companies.

	The handling of chemicals Waste oil Waste oil, contaminated by paint, solvents, poison, solid contaminations and other chemicals is delivered to the plant mainly in barrels. Waste in smaller packings are tapped manually to larger barrels. The barrels are stored at a special place, to later on be transported to SAKAB. Waste solvents The waste arrives to the plant mainly in barrels. The barrels with solvents are stored at a special place, sectioned for chlorated and non chlorated solvents. Smaller packages is handeled in a special solvents-room, where they are emptied by pumps into barrels.The barrels are cleaned through suction by sludge-suction-car and is transported to be temporary stored in hired tanks at Paktank AB, from where the waste is transported to external waste recycling or destruction companies. Routine controls are done before departure. Waste paint The waste arrives to the plant in barrels or smaller packings and is stored. After possible retapping the waste is transported to SAKAB for destruction. Waste glue Is treated in the same way as waste paint. Acid or alkaline waste This waste consists mainly of organic and inorganic acids and lyes and such alkaline waste, that is not processable in the chemical liquid plant. The waste arrives to the plant mainly in barrels. The waste is stored temporary before it is transported to external destruction or dumping companies. Cadmium containing waste The waste arrives to the plant mainly in barrels. The waste is stored temporary before it is transported to external destruction or dumping companies. Heavy metal containing waste The waste arrives to the plant mainly in barrels. The waste is stored temporary before it is transported to external destruction or dumping companies. Some dewatered metal hydroxides can be dumped at Torsviken and some metal contaning baths can be processed in the chemical liquid plant. Cyanide containing waste The waste is handled in the same way as cadmium containing waste. PCB-containing waste Small amounts of PCB-containing waste of the type condensers are taken to the plant and is packed in special packages before they are transported to SAKAB for destruction. Handling as emptying of transformers are not done in the plant. Waste biocides The waste arrives to the plant in various kinds of packing. Liquid waste is tapped on barrels and solid waste is put in boxes. The waste is transported to SAKAB for destruction. Waste from laboratories The waste arrives to the plant in various kinds of packing and is stored at a special place at the plant. Waste that will be transported to SAKAB, whithout change of package, is packed according to SRVFS 1989:2. Certain laboratory waste can be processed in the chemical liquid plant. Laboratory waste as solvents is handled as waste solvents as seen above.

System Boundaries

Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries

About Inventory

Publication	The environmental report from AB GRAAB-KEMI for 1993, The Board of County in Göteborg and Bohus The Department of Environment -- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

	--
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- The Environmental Administration in the municipality of Göteborg Box 360 401 25 Göteborg Sweden.
Practitioner	Hell, Mati - AB GRAAB KEMI Box 4047 4121 Göteborg Sweden.
Reviewer	- The Environmental Administration in the municipality of Göteborg Box 360 401 25 Göteborg Sweden
Applicability	The company has its own transportation unit, which collects the waste from there clients, when more resources are necessary more help is hired. All the waste is accompanied by a declaration of contents before it is collected, handled or treated in the company. The tranporting is not part of the system described in the environmental report, so the environmental load from the transporting is not stated in the table. Waste that is not treatable in the plant is sent to SAKAB or other external waste disposal companies to be recycled or stored. The company is part of Göta älvs Vattenförbund and Göteborg och Bohusläns Vattenvårdsförbund.
About Data	The plant was in operation for 252 hours during 1993. The waste received at the plant amounted to 10583 ton during 1993. A more specified list over the received waste follows below: Waste oil 6 612 m3 Waste lubricating oil 1 809 m3 Waste lubricating fat 237 ton Waste emulsions 454 m3 Acid/Alkaline/Heavy metal containing waste 194 ton Waste chemicals 1 277 ton ____ Tot 10 583 ton

Technical System	
Name	Treatment of oil-contaminated waste water
Functional Unit	m3
Functional Unit Explanation	1 m3 by Ciclean recieved oil-contaminated waste water The oil-contaminated water that comes to the company consist of: 18,6% Ballas, washing and rejected water from ships and oilcontaminated water which has been taken care of at oil disasters and such. 74,6% Oil-contaminated waste water from surface water systems. 2,23% Oil-contaminated water and sludge from ships. 0,401% Emulsions from industries, petrol stations and municipalities. 0,214% Oil-contaminated water from industries and municipalities. 3,88% Oil-contaminated water from cicterns.
Process Type	Gate to gate
Site	CICLEAN AB Box 48047 41821 Göteborg Sweden

Sector	Waste treatment
Owner	CICLEAN AB Box 48047 41821 Göteborg Sweden
Technical system description	Ciclean AB receives and treats oil-contaminated water from ships and waste oil and emulsions from industries in the western parts of Sweden. The company is an affiliated company of AB GRAAB-KEMI, which is owned by Euroc Recycling AB. Ciclean AB are members of Göta älvens Vattenförbund and Göteborgs och Bohusläns Vattenvårdsförbund. The cleaning processes are based on chemical precipitation with aluminiumsulphate, flotation and sand filtration. The aluminiumsulphate is recycled up to 80% and splited oil is pumped to storage tanks to be transported to certified external receiver. The plant, which has a capacity of 500 m3 / hour devided between two processing lines, can also admit processing water containing gasoline or other petrol products, whith low flash-point. The company are memers in Göta älvs Vattenvårdsförbund and Göteborg och Bohusläns Vattenvårdsförbund. A more detalied description follows below: Whithin the plant there are two tanks, each containing 10 000 m3, used for receiving ballast water and other oil-contaminated, one processing tank (2000 m3), a so called settling tank used for separating oil and water and one storage tank (1500 m3) used for separated oil. The plant alo has six smaller receiving tanks (2 pcs of 230 m3 and 4 pcs of 5m m3) so that the company has flexebility and possibility for separat treatment of extremely contaminated water. Some of the receiving tanks are provided with heating and possibility to draft at the top. Ballas water and redjected water are pumped from ships to Cicleans receiving tanks. Also oil-contaminated water from surface water systems whithin Skarvik's and Rya harbours is pumped to these tanks. Oil-contaminated water from industries, municipalities and petrol stations is collected by car to Ciclean and is pumped into the receiving tanks. The oil-contaminated water from the receiving tanks is pumped into the plant and after this the pipelines are flushed with clean water, before they are drained. The oil phase that eventually is formed at the top of the recieving tanks, is transfered to the flotation tanks. Sludge from ships and the top phase from oil separaters whithin the Skarvik and Rya area are also transfered to this tank. The top phase may contain gasoline and other petrol products. In the plant the oil is separated by chemical precipitation with aluminiumsulphate. The pH is adjusted with caustic soda to 6,5. This is done atamatically and is controlled by a pH-electrode. The percipitated contaminations are flocked in the flocking tank. Polyelectrolyte is added to optimize the flocking. The cleansed water is pumped to the clean-water tank through four sand filters. Water from this tank is also used for back flushing of the sand filters. The back-flushing-water is gathered in a tank for dirty water, from where the water is pumped back to the cleaning plant. The cleansed water is later on let out in Göta älv through a control plant where the flow, pH and oil contents are registrated continuously. There are also an automatic taker of specimens situated in the control plant, which takes specimens proportional to the flow. If the incoming water does not contain emulsified oil the water is pumped to the two flotation plants. To the flotation water/air-dispersion at the preassure of 5 to 6 Bar is used. The cleansed water is pumped to the clean-water tank and later on let out in Göta älv. The sepatated oil-containing sludge from the flotation plant is pumped to the recycling tank, where it is heated to 60 deg C. The sludge is then mixed with nitric acid to get pH approx 1. This makes the oil separate from the aluminium hydroxide and float up to the surface. The oil is then noramly unloaded to ships or tankers to be transported to external, certified companies to be recycled or destroyed. The water phase, which consists of an acid aluminium sulphate solvent, is pumped back to the plant where the chemicals can be used to clean the emulcified water.

System Boundaries

About Inventory

Publication	The environmental report from Ciclean AB for 1993, The Board of County in Göteborg and Bohus The Department of Environment --- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology ---
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- The Environmental Administration in the municipality of Göteborg Box 360 401 25 Göteborg Sweden.
Practitioner	Hell, Mati - CICLEAN AB Box 48047 41821 Göteborg Sweden.

Technical System	
Name	Treatment of oil-contaminated waste water
Functional Unit	1 m3 of oil contaminated wastewater from the oil treatment.
Functional Unit Explanation	The water treatment facility is seen as a subsystem to the oil treatment for treatment of the oil contaminated wastewater generated at this facility. In 1997 the received water had the following origin: Industries and municipalities 600 m3 Surface water system 129 012 m3 (1101 m3 from Skarvik) Ballast- wash- and slopwater from vessels and tankers 16 811 m3 Emulsions from industries, municipalities and gas-stations 1739 m3 Cisterns 16 807 m3 (11 310 m3 from Skarvik)
Process Type	Gate to gate
Site	CICLEAN AB Box 48047 41821 Göteborg Sweden
Sector	Waste treatment
Owner	CICLEAN AB Box 48047 41821 Göteborg Sweden
Technical system description	The water treatment facility receives and treats oil-contaminated water from ships and some oil wastes and emulsions from industries in the western parts of Sweden. The waste water is first collected in tanks before filtered where the oil phase is separated from the water. The water phase undergoes two treatment steps, first a flocking tank and later sand filters, before it is let out into the recipient. The oil phase from the reception tank is treated in a settling tank where water is further separated. The cleaning process is based on chemical precipitation with aluminiumsulphate, flotation and sand filtration. The aluminiumsulphate is recycled with up to 80 % and derived oil is pumped to a storage tank for further transportation to a certified external receiver. (The transportation is not a part of the systems function.) Within the plant there are two tanks, each with a capacity of 10 000 m3, used for receiving ballast water and other oil-contaminated water, one processing tank (2000 m3), a so called settling tank used for separating oil and water and one storage tank (1500 m3) used for separated oil. The plant also has six smaller receiving tanks (2 at 230 m3 and 4 at 50 m3) to increase the facility’s flexibility and possibility for separate treatment of particularly contaminated water. Some of the receiving tanks are provided with heating and has the possibility to draft at the top. Oil-contaminated water, e.g. ballast water is pumped from ships to the receiving tanks. Oil-contaminated water from surface water systems within Skarvik- and Rya harbours is also pumped to these tanks. Oil-contaminated water from industries, municipalities and petrol stations is collected and transported by truck to the facility, where it is pumped into the receiving tanks. (The transportation is not a part of the systems function.) Scrap is derived through filtering. As the scrap is combustible it is sent to Sävenäs, a waste fuelled power plant. The oil phase, which eventually is formed at the top of the receiving tanks, is transferred to the settling tank. Sludge from ships and the top phase from oil separators within Skarvik- and Rya harbours are also transferred to this tank. The top phase may contain gasoline and other petrol products. In the settling tank water and oil are split under the influence of heat and the addition of Petrotec RI-54. The derived oil is pumped to a storage tank for further transportation to a certified external receiver. The water goes into the plant. In the plant the oil is separated by chemical precipitation with aluminiumsulphate. The pH is adjusted with caustic soda to 6,5. This is done automatically and is controlled by a pH-electrode. The precipitated contamination is flocked in the flocking tank. Polyelectrolyte (Magnaloc LT 27 AG) is added to optimise the flocking. The cleansed water is pumped to the clean-water tank through four sand filters. Water from this tank is also used for back flushing of the sand filters. The back flushing water is gathered in a tank for dirty water, from where the water is pumped back to the cleaning plant. The cleansed water is later on let out in Götaälv through a control plant where the flow, pH and oil contents are measured continuously. There is also an automatic testing device situated in the control plant, which takes specimens proportional to the flow. If the incoming water does not contain emulsified oil the water is pumped to the two flotation plants. To the flotation water/air-dispersion at the pressure of 5 to 6 bar is used. The cleansed water is pumped to the clean-water tank and later on let out in Götaälv.

	The separated oil-containing sludge from the plant is pumped to the recycling tank, where it is heated to 60ºC. The sludge is then mixed with sulphuric acid to get pH approximately to 1. This makes the oil separate from the aluminium hydroxide and float up to the surface. The oil is then send to the storage tank (see above). The water phase, which consists of an acid aluminiumsulphate-solvent, is pumped back to the plant where the chemicals can be re-used to clean the emulsified water.

System Boundaries

Nature Boundary	Resources that are not seen as limited in Sweden are neglected e.g. land usage and fresh water. The company is legislated to measure the following emissions: Mineral oil TEX (aliphatic) COD Phenol
Time Boundary	The study only deals with retrospective data and no attempts are made to predict future events or conditions. 1997 is assumed as a suitable time frame to collect and interpret data.
Geographical Boundary	The geographical boundary set to Sweden.
Other Boundaries	Cut-off criteria The environmental impact from capital goods and activities serving the process are neglected e.g. personell, infrastructure and facilities. Moreover, maintenance and wear down of the system are neglected. Is is assumed that there occurs no spill at the plant. The chemicals Magnaloc LT 27 AG and Petrotec RI-54 are accumulated in the oil. As the oil leaves as a product their impacts on the environment can not be estimated as emissions at the water treatment facility. The impact that they cause depends on how the oil is used. It is although important to keep in mind that those chemicals has contaminated the oil and should be taken under consideration when emission is calculated for combustion of the product. The oil percentage in the incoming water is thought to be so low that no sedimentation occurs in the receiving tanks. The only sedimitation that occurs at the facility is caused by the derived oil in the storage tank. Scrap derived from filtering is not taken under consideration. As the water from the oil treatment already has been filtered at this facility it is considered to be free from scrap when it is pumped to the water treatment facility. The production of electricity used in the system has not been included.
Allocations	The facility treats various kinds of water but they are all considered to have the same resource use and emission per m3. As described for the functional unit; only the resource use and emissions from treatment of the wastewater from the oil treatment facility is of interest, therefore are only those impacts accounted for.
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1997
Data Type	Unspecified
Represents	See 'Function'.
Method	Data are acquired from study of the environmental report of 1997 and inquires to the employees at the facility. Emissions of hevy metals are modelled from data in the environmental report for Reci Halmstad. This is done due to unsufficient data about these emissions. The modelled data has been taken from the incoming water to the water treatment. Companies hired for analysing the specimens taken are; Svenska Saybolt AB, Kemanalys AB and Analycen AB. The subtances are divided with the total amount of recieved oil-contaminated water (164 969 m3) to represent amount per functional unit.

let out in Göta älv.									
Date concieved: 1997 Data type: Unspecified Method: Inquiry with the production manager at Reci Halmstad, Bengt Borg. The waste oil is supposed to cause a sedimentation of 0,25% at Reci´s facility in Halmstad. The data is supposed to be representative for the sedimentation at Ciclean as well, calculated on the amount of extracted oil (waste oil). Literature: Bengt Borg, production manager at Reci Industri Halmstad. Notes: The oil sludge, caused by sedimentation in the oil storage tank, is derived when the tank is cleansed. As this is not an every-year-procedure the amount of sediment per cubic metre is estimated as above. The oil sludge is transported to SAKAB for destruction.	Output	Residue	Oil-sludge	0.0001			m3	Technosphere	Sweden

About Inventory

Publication	Master thesis: ''LCA on converted fuel oil'' by Daniel Strandberg and Christer Wik, MSc students Technical environmental planning, Chalmers Univeristy of Technology -- Data documented by: Daniel Strandberg and Christer Wik, MSc students, Technical Environmental Planning, Chalmers University of Technology Documentation reviewed and classified by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	Internal use at Reci Industri
General Purpose	The objective of this study was to carry out a Life Cycle Assessment for converted fuel oil. The analysis involves outlining the environmental hazardous steps in the production. The result will be used internally to aid as an environmental improving guidance as well as to receive a better view of the process. Externally the result is a part of Reci's ISO 14000 certification, which acts as a guarantee to the customers. The quality of the inquiry is set due to the standards of a Master of Science thesis.
Detailed Purpose	To estimate the resource use and emissions released treating oil contaminated water.
Commissioner	Schaff, Lars, environmental manager - Reci Industri AB Box 48047 418 21 Göteborg Sweden.
Practitioner	Strandberg, Daniel and Christer Wik - MSc students Technical Environmental Planning Chalmers University of Technology 41296 Göteborg Sweden.
Reviewer	Beckman, Torsten - Technical environmental planning Chalmers University of Technology 412 96 Göteborg Sweden
Applicability	The data represented are site-specific and are only valid for treatment of wastewater from Skarvik. As the incoming water is of very varying composition and quantity the impact per functional unit may vary quite much. The data shall therefore be seen as estimation of the impacts made. The chemicals Magnaloc LT 27 AG and Petrotec RI-54 are accumulated in the oil. As the oil leaves as a product their impacts on the environment can not be estimated as emissions at the water treatment facility. The impact that they cause depends on how the oil is used. It is although important to keep in mind that those chemicals has contaminated the oil and should be taken under consideration when emission is calculated for combustion of the product.
About Data	The oil-sludge, caused by sedimentation in the oil storage tank, is derived when the tank is cleansed. As this is not an every-year-procedure the amount of sediment per cubic metre has to be estimated. The waste-oil is supposed to cause sedimentation of 0,25% at Reci's facility in Halmstad. The data is supposed to be representative for the sedimentation at Reci Göteborg as well, calculated on the amount of treated oil. Mass balance Input approximately 165 000 m3. Output about 163 200 m3. Difference 1800 m3. When put into perspective of the total inflow the difference can be assumed to be a measurement error. As the treatment of oil-contaminated water is a continual process and flows are only measured when entering or leaving the system it is also plausible that an significant volume was still in the system when inflows and outflows where reported. The most likely explanation is a measurement error on the inflow and outflow of water. The total inflow was 164 969 m3and the total outflow 158 214 m3. To achieve mass balance the inflow is supposed to be 1000 m3 lesser and the outflow 800 m3 more.
Notes	The reviewer acted as supervisor for the Master thesis: ''LCA on converted fuel oil''

SPINE LCI dataset: Treatment of sewage

Technical System	
Name	Treatment of sewage
Functional Unit	m3
Functional Unit Explanation	1 m3 sewage that has come to the works to be cleansed.
Process Type	Gate to gate
Site	GRYAAB Karl IX:s väg 418 34 Göteborg Sweden
Sector	Waste treatment
Owner	GRYAAB Karl IX:s väg 418 34 Göteborg Sweden
Technical system description	The process consist of 1. sewage and sludge treatment at Ryaverket 2. sludge treatment and dumping in the rock shelter at Syrhåla 3. sludge combustion at Tankgatan. GRYAAB takes care of the sewage in the region of Gothenburg. It is owned by the municipality of Ale, Göteborg, Härryda, Kungälv, Lerum, Mölndal and Partille. Approximatly 11% of the incoming sewage comes from the industry, medical service and public administration. The rest comes from households, except for the sewage from 3000 companies. The companies sewage differs in some ways from household sewage, but is not classed as industrial sewage. The recipient for the cleansed water is Göta älv. 1. Ryaverket is built to take care of sewage from 680 000 people. At Ryaverket the sewage is cleaned (a) physically, (b) chemically and (c) biologically. (a) The incoming sewage is pumped in to the sewage treatment works. The intake is covered with grating. The sewage is then distributed to 12 different pre sediment reservoirs. The solid particles are removed here. (b) The sewage is pumped to the airing reservoirs, where active dredge, consisting of bacteria and other micro organisms, is mixied with it. When the water is aired some of the contamination is ''eaten'' by the bacteria. After approximately 2 h the water is led to the post sediment reservoirs. In the reservoirs the active sludge is sedimented and seperated from the water. The greater part of the sedimented sludge is pumped back to the airing reservoirs to be used again, the rest is cleansed. Some of the energy that is used to pump the water is gained by letting the water pass through a turbine at the outlet. (c) Irondisulphate is used to precipitate phosphorus. The irondisulphate is dosed at the inlet or in the pre sediment reservoir. The dosage is 1,0-1,3 mole iron per mole phosphorus.The precipitated ironphosphate is corporated in the active sludge flocks. Sludge treatment at Ryaverket Particles greater than 3 mm (in diameter) are removed from the dredge. The sludge is thickened. In a digester plant the bacteria transform the decomposable parts of the dredge. This is done in an anaerobic environment. At the breaking down energenic biogas is made. The gas consists of 60-65% marsh gas and 35-40% carbondioxide. Due to the fact that the organic materials is broken down the treated sludge is almost odourless, compared with the untreated sludge. The biogas plant consists of two digesters, one slam silo and equipment for energy recycling and the handling of gas. The foot-outlet of the four dredge thickener four pumps pump the thickened dredge to the digesters. On the way in to the digester the heat from the outgoing sludge is exchanged to the ingoing. In this way 50% of the energy used to warm the sludge it saved. The Ryaverk is also able to receive external organic material, like food left-overs, fat, and such from restaurants and so on. This is dygested with the sludge to increase the production of biogas. The digesters keep a temperature of 37 °C because the slugde is circulated trough a heat exchanger where the sludge is heated by hot water. The sludge is digested for approx.15 days. In the degas chamber air is blown through the digested sludge, which stops the digesting process. The sludge is then dewatered and is eventually

	stored in rock shelters. Certain sludge can be used as fertilizer. Sometimes lime is added to the sludge. Waste, which has been removed from the sewage in the cleaning process is dumped at Tagene. Building material is dumped at Tagene or Gunnilse. The material that is recycleble, is recycled and the small quantities of waste that is hazardous to the environment is sent to Reci Industri AB. 2. The sludge is dewatered and stored in rock shelters. In the storage process gas is produced. Some is used in the Ryaverk for heating, and some is directly combusted. 3. Some of the sludge is mixed with bark and composted for 5-8 weeks.

System Boundaries

Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	The municipal of Ale, Göteborg, Härryda, Kungälv, Mölndal and Partille, Sweden.
Other Boundaries	The energy that is both produced and consumed in the plant is not shown in the flow table, though the emissions caused is taken into account.
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1996
Data Type	Unspecified
Represents	
Method	Studying the environmental report. The data in the table has been converted into amounts per functional unit. The data from the environmental report has therefore been devided by the annual production for 1996, which was 104,1 Mm3.
Literature Reference	The Environmental Report from GRYAAB for 1996, The Environmental Administration in the municipality of Göteborg.
Notes	The data type unspecified implies that one does not know the origin of the data. The method for taking the spiecements of water and dredge is described under Specific QMetaData for AOX. The method for analysing the spieciment is presented for each emitted substance on specific QMetaData/method.

About Inventory	
Publication	The environmental report from GRYAAB for 1997, the Environmental Administration at the municipal of Göteborg. -- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	To show the environmental load
General Purpose	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg. .
Practitioner	Robinsson, Peter - GRYAAB Karl IX:s väg 418 34 Göteborg Sweden.
Reviewer	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg.
Applicability	In some cases it can seem more efficient to look at the environmental load per amount cleansed water. It is then neccesary to know that 1 m3 sewage equals to 0,969260326609 m3, in the sewage treatment works, cleansed water. In the table, under specific QMetaData for Sewage (Resource) and Water (Product) the amount of contaminations are shown, so a comparison between the incoming sewage and the outgoing water can be made. Ryaverket is built to take care of sewage from 680 000 people.
About Data	In regard to the contamination of BOD(7) the actual load on the works is equivalent to the amount of sewage from 613 000 persons (582 000 excl. internal recirculation). This means a maximum flow of 4 m3/s. The total amount of sewage received at Ryaverket 1996 was 104,1 Mm3. The municipals that delivers sewage to Ryaverket contributes with the following percentages: Ale 2,1%, Göteborg 80,7%, Härryda 2,7%, Kungälv 2,5%, Mölndal 8,7% and Partille 3,3%. Energy The energy that is both produced and consumed in the plant is not shown in the flow table, though the emissions caused is taken into account. The energy flows are Total amount produced biogas 45,953 GWh Total amount produced electricity from water turbine 0,50 GWh City gas (bought) 0,27 GWh Total amount bought electricity 12 GWh Total amount used biogas 22,953 GWh Total amount wasted biogas (torch) 2,8 GWh Total amount of used electricity produced from biogas 13,75 GWh Total amount of used electricity (bought) 12,664 GWh Total amount of sold heat (district heating) 3,2 GWh Total amount of biogas used to run motor vehicles 0,125 GWh Energy waste 6 GWh After adding the produced and used energy, one notice that it does not sum up. The result is -2,769 GWh. Water The water that comes from the dewatering process at Syrhåla and Ryaverket is led back to the inflow of the sewage treatment works. During 1996 the recirculated water amounts to 2,48 Mm3, which is included in the total calculated inflow (104,1 Mm3).
Notes	

SPINE LCI dataset: Tree plant nursing

Administrative	
Finished	Y
Date Completed	1994-02-24
Copyright	None
Availability	Public

Technical System	
Name	Tree plant nursing
Functional Unit	1000 p
Functional Unit Explanation	1000 pieces of tree plants
Process Type	Gate to gate
Site	Middle Sweden
Sector	Forestry
Owner	Middle Sweden
Technical system description	From collected seed, plants are nursed in special green houses. This includes peat handling and sowing, internal transports, breeding in greenhouse, breeding in open air, and finally packing. Peat handling and sowing is done by two el. machines (6 kW and 50% utilisation), sowing the seed in a peat filled plastic case. 5 plastic cases per 1000 plants are used 4 times before wasted. Transport of tree plants to greenhouse by tractor (60 kW and 50% utilisation). Breeding in greenhouse includes lightning and heating. Dimensions of the greenhouse: 2000 m2 and 8 m high. Capacity: 1500000 plants per greenhouse. The greenhouse is heated by combusting diesel oil. Transport from the greenhouse to outside cultivation. Transport of tree plant to packaging room. Packing of plants is conducted by a el. machine into cardboard boxes (6 kW) Assuming the same kind of fertilizer as in fertilizing of forest: SKOG-CAN 27,2% N

System Boundaries	
Nature Boundary	Emissions caused by combustion of fuels is not included.
Time Boundary	The data collected are representative for the time period 1992-1994.
Geographical Boundary	Central Sweden.
Other Boundaries	The use of cardboard boxes is not included.
Allocations	N/A
Systems Expansions	N/A

About Inventory

Publication	None -- Data documented by: Göran Swan, Ola Svending, STORA Corporate Research Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	LCA practitioners
General Purpose	The purpose is to supply with LCA-data for forestry to be used in further studies of wood products.
Detailed Purpose	These data are an update of earlier data on the same subject. To be used in LCA representing the plant nursing part of forestry in central Sweden. Can also be used as an average for Sweden.
Commissioner	- Stora Corporate Research, Box 601 661 29 Säffle Sweden.
Practitioner	Swan, Göran - Stora Corporate Research, Box 601, S-661 29 Säffle, Sweden.
Reviewer	Brindbergs, Mats - Stora Skog, Åsgatan 22, S-79180 Falun, Sweden
Applicability	These data are valid for large scale nursery in forestry. It is important to check the type of fuel used. In this case, fossil fuel is assumed to be used. Other data is available from other forest companies, or from Skogforsk, or STFI. The silviculture process in Sweden has eight steps:

	1. Plant nursing 2. Soil preparation 3. Planting 4. Clearing 5. Thinning 6. Fertilizing 7. Final felling 8. Forwarding This is the first step.
About Data	If an average for other parts of Sweden is desired, a different amount of energy for heating may be used.
Notes	N/A

SPINE LCI dataset: Truck chassi manufacturing. ESA-DBP

Administrative	
Finished	Y
Date Completed	2001
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public.

Technical System	
Name	Truck chassi manufacturing. ESA-DBP
Functional Unit	One chassi á 5275 kg.
Functional Unit Explanation	See 'Function'.
Process Type	Gate to gate
Site	Unknown
Sector	Machinery and equipment
Owner	Unknown
Technical system description	Excerpt from the report, see 'Publication': ''The truck chassis are manufactured by Volvo AB and the model is FL6E. One chassis weighs 5275 kg and consists of several materials, mainly iron and steel. Volvo has previously performed an LCA of two heavier truck models, FH12 and FM12, and presented the results as an environmental product declaration (Volvo AB, 2001). An LCA practitioner at Volvo (R. Svensson, personal communication) helped downscaling the material content of these trucks into quantities relevant to the FL6 model, according to materials in the main parts of a truck. The results, after some aggregations of similar materials, are given in Table 3. Table 3. Materials in a FL6 chassis. Material Weight [kg] Iron and steel 3991 Aluminium 150 Lead battery 122.6 Copper, brass and bronze 62.7 Plastics 295.4 Rubber (mainly tires) 438 Glass 48.6 Textile, other fibres 22.8 Paint 8.1 Oil, grease and bitumen 55.1 Wood 0.3 Cooling agent R134a 1.0 Glycol 14.0 Other 89''

	This process is included in the system described in Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. Environmental Systems Analysis report 2005:7, Chalmers University of Technology, Gothenburg, Sweden at http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--7.pdf Other processes in the CPM Database also included in the above publication: Truck tire production. ESA-DBP Transportation with diesel driven waste collection vehicle. ESA-DBP Transportation with gas driven waste collection vehicle. ESA-DBP Transportation with hybrid (gas-electric driven) waste collection vehicle. ESA-DBP Collection area driving, with diesel driven waste collection vehicle. ESA-DBP Collection area driving, with gas driven waste collection vehicle. ESA-DBP Collection area driving, with hybrid (gas-electric driven) waste collection vehicle. ESA-DBP Collection stop, with diesel driven waste collection vehicle. ESA-DBP Collection stop, with gas driven waste collection vehicle. ESA-DBP Collection stop, with hybrid (gas-electric driven) waste collection vehicle. ESA-DBP Waste collection vehicle, diesel driven. ESA-DBP Waste collection vehicle, driven by compressed natural gas. ESA-DBP Waste collection vehicle, driven by electricity and compressed natural gas. ESA-DBP

System Boundaries

Nature Boundary	The manufacturing process is a gate-to-gate process and does not include the resources needed. Theese are specified in 'Function'.
Time Boundary	Data originally presented in an environmental product declaration from Volvo AB for the year 2001.
Geographical Boundary	The chassi is manufactured by Volvo AB, in Sweden.
Other Boundaries	Excerpt from the report, see 'Publication': ''A diesel truck and a gas truck have some construction differences, primarily concerning the engine. The data used in this study represent manufacturing of a diesel truck. Data representing a gas truck were not available, but the differences were assumed to be small in relation to a complete vehicle.''
Allocations	Not applicable.
Systems Expansions	Not applicable.

About Inventory	
Publication	Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. Environmental Systems Analysis report 2005:7, Chalmers University of Technology, Gothenburg, Sweden http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--7.pdf
Intended User	LCA practitioners.
General Purpose	Master Thesis Report
Detailed Purpose	This process data set is a part of the LCA for 'Gas-Electric Hybrid Waste Collection Vehicle'.
Commissioner	Not applicable - .
Practitioner	Anna Boss - .
Reviewer	Carl Jensen, Renova AB and Karin Andersson, Chalmers -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.
About Data	Excerpts from the report (for report see link in 'Publication'): ''Data concerning production of aluminium, copper and steel were found in an LCA study by Sunér (1996). Steel is the material making up the main part of the vehicle. Data for the steel production represents primary steel production at SSAB tunnplåt in Luleå, Sweden, with an economic allocation among materials produced there, and also production of secondary steel at Fundia steel in Smedjebacken, Sweden. Primary and secondary steel were presented separately in the report. To get usable data for the waste collection vehicle, the proportions used was assumed to be 60% primary and 40% secondary steel, which is the world average (SSAB, 2004).'' NB: References in the above text can be found in the report, in 'Literature Reference'. ''Copper was produced at Rönnskär smelter, Boliden mineral AB in Skelleftehamn, Sweden. 25-30% was secondary material. An economic allocation among several materials was used. The amount of copper raw material used in Sunér's economic allocation did not agree with the amount of metal produced. (Less raw copper was used than copper metal produced.) Therefore, the unallocated value for copper resource consumption was used instead.'' ''Data used concerning production of paper, wood and glass are average data of these material groups (Rydh and Sun, 2003). The wood used was assumed to be of the "low impact" group.'' NB: References in the above text can be found in the report, in 'Literature Reference'. ''Brake pads production was calculated as steel, electronics as copper and bitumen as oil. Environmental impact from the material production was then calculated using general material inventory data (section 3.1.1). The amount of lead batteries, as in Table 3, was originally given as content of lead in the truck, but was recalculated as lead batteries. This was done by using the same material composition as in the batteries used in the loading of the hybrid vehicle, but without steel through, and at the same time decreasing the amount of plastics and removing sulphuric acid from the list. The same battery production data were used as for the production of hybrid equipment batteries (see section 3.2.3)'' NB: Table 3 in the above text is the same table as table 3 in 'Function'. ____ ESA Database Project. Years: 2009-2011. Administering organisation: Chalmers University of Technology, the department of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA), assisted by Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).

SPINE LCI dataset: Truck Göteborg to SAKAB

Administrative	
Finished	Y
Date Completed	1999-04-20
Copyright	
Availability	public

Technical System	
Name	Truck Göteborg to SAKAB
Functional Unit	36 m3 oil-sludge transported from Göteborg to Sakab
Functional Unit Explanation	The loading capacity of the truck is 40 ton. All transports are carried out full loaded to Sakab and empty on return.
Process Type	Gate to gate
Site	
Sector	Land transport
Owner	
Technical system description	Transporting oil-sludge from Göteborg to SAKAB, 250 km. Totally was 36 m3 oil-sludge transorted from Göteborg to Kumla during 1997. The density of oil sludge is one ton / m3. The vehicle arrives to Kumla full loaded but is empty on the return. Transporting oil-sludge from the source to the destination by truck of type Euro class 1 consuming fuel class MK1. The weight of the vehicle is 60 ton full loaded (40 ton oil-sludge). The transports are all carried out on main roads. Reci's own transportation division carries out the transportation with four vehicles. All transports are carried out full loaded or empty. The transportation step consumes diesel and releases emissions to the system environment.

System Boundaries	
Nature Boundary	Only emissions legeslated by law is represented by NTM.
Time Boundary	The study only deals with retrospective data and no attempts are made to predict future events or conditions. 1997 is assumed as a suitable time frame to collect and interpret data.
Geographical Boundary	The geographical boundary is set to Sweden.
Other Boundaries	The loading and unloading steps are neglected in terms of resource use and emissions. The environmental impact from capital goods and activities serving the process are neglected e.g. personell, infrastructure and facilities. Moreover, maintenance and wear down of the system are neglected. It is assumed that there occurs no spill.
Allocations	
Systems Expansions	

Flow Data	
General Activity QMetaData	
Date Conceived	1998-12-29
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	The truck's engine is of type Euro class 1 and it consumes diesel MK1. NTM presents data about the emissions. NOx, HC, PM, CO, CO2 are presented in grams released per litre fuel consumed. SO2 is presented in part per million (ppm). The fuel consumption is 0,5 litre/km for the truck when full-loaded (Tomas Larsson) and 0,31 litre/km when empty (NTM). The density for diesel is 0,81 kg / litre and 9,77 kWh / litre. (NTM) Transporting oil-sludge from

	Göteborg to SAKAB, 250 km. Totally was 36 m3 oil-sludge transorted from Göteborg to Kumla during 1997. The density of oil sludge is one ton / m3. The vehicle arrives to Kumla full loaded (40 tonnes of cargo) and is empty on the return.
Literature Reference	http://www.ntm.a.se/emissioner/car/inledning/htm, latest uppdated 1998-09-08 Tomas Larsson truck driver Reci Transport AB
Notes	See 'Nature Boundaries', 'Function' and 'Functional Unit'.

About Inventory

Publication	Master thesis: ''LCA on converted fuel oil'' by Daniel Strandberg and Christer Wik, MSc students Technical environmental planning, Chalmers Univeristy of Technology --- Data documented by: Daniel Strandberg and Christer Wik, MSc students, Technical Environmental Planning, Chalmers University of Technology Documentation reviewed and classified by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology ---
Intended User	Internal use at Reci Industri
General Purpose	The objective of this study was to carry out a Life Cycle Assessment for converted fuel oil. The analysis involves outlining the environmental hazardous steps in the production. The result will be used internally to aid as an environmental improving guidance as well as to receive a better view of the process. Externally, the result is a part of the Reci's ISO 14 000 certification which acts a guarantee to the costumes. The quality of the inquiry is set due the standards of a Master of Science thesis.
Detailed Purpose	To estimate the resource use and emission released from the vehicle during transportation.
Commissioner	Schaff, Lars, environmental manager - Reci Industri AB Box 48047 418 21 Göteborg Sweden.
Practitioner	Strandberg, Daniel and Christer Wik - MSc students Technical Environmental Planning Chalmers University of Technology 41296 Göteborg Sweden.
Reviewer	Beckman, Torsten - Technical environmental planning Chalmers University of Technology 412 96 Göteborg Sweden
Applicability	The data are specific for transportation by truck. Data are valid for average truck-transportation in Sweden. The calculations are conducted with the trucks employed by Reci Transport AB. The transports that are carried out by entrepreneurs are assumed to employ trucks with the same characteristics.

About Data	NTM has in association with VOLVO Trucks and Scania conducted simulations and calculations during 1997 to established the fuel consumption for trucks, both when full loaded and empty. The simulations are based on certification values of engines and the fuel consumption during operation under Swedish conditions. The emissions that are released from the truck are coupled to the fuel consumption, which is known for full loaded trucks employed by Reci. The data concerning fuel consumption for empty trucks that are presented by NTM is used. When the fuel consumption is known for a particular vehicle, its specific release of emissions can be calculated. The relevance of the gathered data was verified with Tage Hilmersson, Manager at Reci Transport AB in Stenungsund. Specific fuel consumption for the vehicles conducted for transportation was recieved from Tomas Larsson, truck driver at Reci Transport AB in Stenungsund. If data is utilised from this thesis it should be conducted with prudence. For receiving a more sufficient result for another activity, measurement should be utilised for each specific item in the production chain. However, the data represented in this study is of sufficient quality for being conducted when benchmarking.
Notes	The reviewer acted as supervisor for the Master thesis: ''LCA on converted fuel oil''

Technical System

Name	Truck Halmstad to SAKAB
Functional Unit	241 m3 oil-sludge transported from Halmstad to Sakab.
Functional Unit Explanation	The loading capacity of the truck is 40 ton. All transports are carried out full loaded to Sakab and empty on the return.
Process Type	Gate to gate
Site	
Sector	Land transport
Owner	
Technical system description	Transporting oil-sludge from Halmstad to SAKAB, 385 km. The total amount of oil sludge from Halmstad to Kumla during 1997 was 241 m3. The density of oil sludge is one ton / m3. The vehicle arrives to Kumla full loaded but is empty on the return. Transporting oil-sludge from the source to the destination by truck of type Euro class 1 consuming fuel class MK1. The weight of the vehicle is 60 ton full loaded (40 ton oil-sludge). The transports are all carried out on main roads. Reci's own transportation division carries out the transportation with four vehicles. All transports are carried out full loaded or empty. The transportation step consumes diesel and releases emissions to the system environment.

System Boundaries

Nature Boundary	Only emissions legeslated by law is represented by NTM.
Time Boundary	The study only deals with retrospective data and no attempts are made to predict future events or conditions. 1997 is assumed as a suitable time frame to collect and interpret data.
Geographical Boundary	The geographical boundary is set to Sweden.
Other Boundaries	The loading and unloading steps are neglected in terms of resource use and emissions. The environmental impact from capital goods and activities serving the process are neglected e.g. personell, infrastructure and facilities. Moreover, maintenance and wear down of the system are neglected. It is assumed that there occurs no spill.
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1998-12-29
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	The truck's engine is of type Euro class 1 and it consumes diesel MK1. NTM presents data about the emissions. NOx, HC, PM, CO, CO2 are presented in grams released per litre fuel consumed. SO2 is presented in part per million (ppm). The fuel consumption is 0,5 litre/km for the truck when full-loaded (Tomas Larsson) and 0,31 litre/km when empty (NTM). The density for diesel is 0,81 kg / litre and 9,77 kWh / litre. (NTM) Transporting oil-sludge from Halmstad to SAKAB, 385 km. The total amount of oil sludge from Halmstad to Kumla during 1997 was 241 m3. The density of oil sludge is one ton / m3. The vehicle arrives to Kumla full loaded (40 tonnes of cargo) but is empty on the return.

About Inventory

Publication	Master thesis: ''LCA on converted fuel oil'' by Daniel Strandberg and Christer Wik, MSc students Technical environmental planning, Chalmers Univeristy of Technology -- Data documented by: Daniel Strandberg and Christer Wik, MSc students, Technical Environmental Planning, Chalmers University of Technology Documentation reviewed and classified by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	Internal use at Reci Industri
General Purpose	The objective of this study was to carry out a Life Cycle Assessment for converted fuel oil. The analysis involves outlining the environmental hazardous steps in the production. The result will be used internally to aid as an environmental improving guidance as well as to receive a better view of the process. Externally, the result is a part of the Reci's ISO 14 000 certification which acts a guarantee to the costumes. The quality of the inquiry is set due the standards of a Master of Science thesis.
Detailed Purpose	To estimate the resource use and emission released from the vehicle during transportation.
Commissioner	Schaff, Lars, environmental manager - Reci Industri AB Box 48047 418 21 Göteborg Sweden.
Practitioner	Strandberg, Daniel and Christer Wik - MSc students Technical Environmental Planning Chalmers University of Technology 41296 Göteborg Sweden.
Reviewer	Beckman, Torsten - Technical environmental planning Chalmers University of Technology 412 96 Göteborg Sweden
Applicability	The data are specific for transportation by truck. Data are valid for average truck-transportation in Sweden. The calculations are conducted with the trucks employed by Reci Transport AB. The transports that are carried out by entrepreneurs are assumed to employ trucks with the same characteristics.
About Data	NTM has in association with VOLVO Trucks and Scania conducted simulations and calculations during 1997 to established the fuel consumption for trucks, both when full loaded and empty. The simulations are based on certification values of engines and the fuel consumption during operation under Swedish conditions. The emissions that are released from the truck are coupled to the fuel consumption, which is known for full loaded trucks employed by Reci. The data concerning fuel consumption for empty trucks that are presented by NTM is used. When the fuel consumption is known for a particular vehicle, its specific release of emissions can be calculated. The relevance of the gathered data was verified with Tage Hilmersson, Manager at Reci Transport AB in Stenungsund. Specific fuel consumption for the vehicles conducted for transportation was recieved from Tomas Larsson, truck driver at Reci Transport AB in Stenungsund.

	If data is utilised from this thesis it should be conducted with prudence. For receiving a more sufficient result for another activity, measurement should be utilised for each specific item in the production chain. However, the data represented in this study is of sufficient quality for being conducted when benchmarking.
Notes	The reviewer acted as supervisor for the Master thesis: ''LCA on converted fuel oil''

Applicability	For applicability for the process see 'Technical System' and 'System Boundaries'.
About Data	Excerpt from the report (for report see link in 'Publication'): ''The rubber used is mainly for tires (which are often replaced). Car tires manufactured at Continental AG have been studied in an LCA (Krömer et al., 1999). In the presentation of the inventory, results for production and use are summed up, but there are also figures on the amounts of total resource use, air and water emissions and waste respectively in different phases of the life cycle. Using these figures, the environmental impacts from the production phase, which is the relevant part for this study, was calculated. Regarding resources, all were assigned to the production phase except petroleum. Petroleum was instead estimated by the ratios of total resource use in the raw material acquisition, production and transport, respectively, and the fraction that petroleum makes up of the total resources in each of these processes. Furthermore, petroleum was assumed to be equivalent to crude oil since natural gas was presented separately. The production phase accounts for 4.6% of the emissions to air, except for CO_2 and CO, which make up 98% and 1.2%, respectively, of the emissions during use. The rest of the total CO_2 and CO emissions were assigned to the production phase. 97.2% of the emissions to water was assigned to the production phase. The waste generated comes to 95.4% from the production phase, but for inert residues, the share from production is 23.7%. To clarify what values have been used, the inputs and outputs for production of one tire of 5.47 kg are presented below in Table 2. When using these data in this LCA to represent truck tires, the values were scaled up according to weight.'' NB: The ''Table 2'' from the above text, is represented by the 'Flow Table' above. ____ ESA Database Project. Years: 2009-2011. Administering organisation: Chalmers University of Technology, the department of Environmental Systems Analysis.

SPINE LCI dataset: Truck with semitrailer, max 42 tonnes, future

Administrative	
Finished	Y
Date Completed	1997-11-19
Copyright	NGM (Nätverket för Godstransporter och Miljön)
Availability	This version is only available to the members of NTM. The data is continously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se.

Technical System	
Name	Truck with semitrailer, max 42 tonnes, future
Functional Unit	1 tonkm, 70 %
Functional Unit Explanation	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if *empty trips are not included.*
Process Type	Unit operation
Site	Sweden
Sector	Land transport
Owner	Sweden
Technical system description	Operation of a diesel driven truck with semitrailer, with engine representing best available technology (proposed Euro 3 environmental standard) with oxidation filter and catalytic control. The equipage is used for international long-distance traffic. Maximum gross weight: 42 tonnes. Kerb weight: 17 tonnes. Available loading capacity with regard to weight: 25 tonnes. Length: 18,5 metres.

System Boundaries	
Nature Boundary	Regulated emissions to air are included. The parameters that are presented are: -regulated emissions for diesel engines: NOx, HC, particles and CO -fuel regulated: SO2 -tax regulated CO2. Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.
Time Boundary	The data represents best available technology, not yet in regular use.
Geographical Boundary	The data is based on Swedish conditions.
Other Boundaries	The average utilisation level is 70 % which is representative for Swedish domestic traffic if *empty trips are not included.* *Parameters not considered* -Driving technique -External conditions i.e. road conditions, climate etc. -Maintenance level of the vehicle *Excluded subsystems* -Exhaust emission control -Precombustion, i.e. production and distribution of the fuel

About Inventory

Publication	*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997,* NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997 -- Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM --
Intended User	Suppliers and buyers of goods
General Purpose	There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The

	work is also intended to serve as a forum for discussion between different actors in the transportation business. The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen
Detailed Purpose	The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives. The ambition was to present data for the ''best'', average and ''worst'' technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
Commissioner	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
Practitioner	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
Reviewer	
Applicability	The ambition with the data was to get a picture of future energy use and emissions. The data represents best available technology, not yet in use.
About Data	The data is based on tests on the engine performed in a laboratory according to a new test cycle (proposed for standardisation). This means that several parameters that influence the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.
Notes	The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se. The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998. The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives. The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

SPINE LCI dataset: Truck with semitrailer, max 42 tonnes, manufactured after 1996 [Euro 2]

Date Completed	1997-11-19
Copyright	NGM (Nätverket för Godstransporter och Miljön)
Availability	This version is only available to the members of NTM. The data is continously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se.

Technical System	
Name	Truck with semitrailer, max 42 tonnes, manufactured after 1996 [Euro 2]

Functional Unit	1 tonkm, 70 %
Functional Unit Explanation	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if *empty trips are not included.*
Process Type	Unit operation
Site	Sweden
Sector	Land transport
Owner	Sweden
Technical system description	Operation of a diesel driven truck with semitrailer, with engine manufactured after 1996 (Euro 2 environmental standard). The equipage is used for international long-distance traffic. Maximum gross weight: 42 tonnes. Kerb weight: 17 tonnes. Available loading capacity with regard to weight: 25 tonnes. Length: 18,5 metres.

System Boundaries	
Nature Boundary	Regulated emissions to air are included. The parameters that are presented are: -regulated emissions for diesel engines: NOx, HC, particles and CO -fuel regulated: SO2 -tax regulated CO2. Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.
Time Boundary	The data represents trucks with engine manufactured after 1996
Geographical Boundary	The data is based on Swedish conditions.
Other Boundaries	The average utilisation level is 70 % which is representative for Swedish domestic traffic if *empty trips are not included.* *Parameters not considered* -Driving technique -External conditions i.e. road conditions, climate etc. -Maintenance level of the vehicle *Excluded subsystems* -Exhaust emission control -Precombustion, i.e. production and distribution of the fuel -Maintenance of the vehicle -Erection and operation of infrastructure -After-treatment of the vehicle -Handling of production rests
Allocations	N/A
Systems Expansions	N/A

Flow Data	
General Activity QMetaData	
Date Conceived	1997-01-01
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The *quantity value for the energy use* refer to average fuel consumption, *the maximum and minimum value* refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For *emissions of NOx, HC, particles and CO, the quantity value* refer to an average engine guaranteed by Volvo Truck Corporation, the *maximum value* refer to an engine run 500 000 km. No minimum value was given.

Practitioner	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
Reviewer	
Applicability	The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out. ***Handling of goods*** Road transports generally consists of 1-3 routes: 1. Collection of the goods to terminal 2. Long-distance transport between terminals 3. Distribution of the goods from terminal The collection and distribution routes are generally performed by smaller vehicles --*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the

terminal for further transport.
--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited
--*Parcel goods (<100 kg)* are normally handled in small vehicles

The following vehicles and equipages are used for transportation in Sweden:
--*Truck max 3,5 tonnes* is mainly used for transportation of parcels.
--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.
--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.
--*Truck, max 24 tonnes* is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.
--*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is *only used for Swedish domestic long-distance transport.* The vehicle is also permitted in Finland.
--*Truck with semitrailer, max 42 tonnes* is used for international long-distance traffic.

Utilisation level
The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):
-excavated materials and round timber - 50%
-manufactured products (wholesale goods) - slightly more than 20%
-provisions and animal forage - approx. 15%
-mixed cargo (general goods) approx - 10 %.

The Swedish fleet
The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:
After 1996: 10 %
95-92: 33%
Before 1992 52 %
The data was given by SIKA and SCB and concern vehicles larger than 3,5 tonnes.

Bulky goods
The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m3. The conversion factor is generally accepted in the transportation business.

Fuel
The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NOx emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. ''Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik'', Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.

International road transports
The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.

About Data

Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.

Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.

The data on emissions is largely based on tests on the engine performed in a laboratory according to a *standardised test cycle*. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.

A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the

	maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute. The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).
Notes	The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se. The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998. The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives. The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

Flow Data

General Activity QMetaData

Date Conceived	1997-01-01
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The *quantity value for the energy use* refer to average fuel consumption, the *maximum and minimum value* refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For *emissions of NOx, HC, particles and CO, the quantity value* refer to an average engine guaranteed by Volvo Truck Corporation and the *maximum value* refer to voluntary European emission regulations for diesel engines before 1992.

About Inventory	
Publication	*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997,* NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997 -- Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM --
Intended User	Suppliers and buyers of goods
General Purpose	There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business. The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen
Detailed Purpose	The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives. The ambition was to present data for the ''best'', average and ''worst'' technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
Commissioner	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.

Practitioner	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
Reviewer	
Applicability	The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out. ***Handling of goods*** Road transports generally consists of 1-3 routes: 1. Collection of the goods to terminal 2. Long-distance transport between terminals 3. Distribution of the goods from terminal The collection and distribution routes are generally performed by smaller vehicles --*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport. --*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited --*Parcel goods (<100 kg)* are normally handled in small vehicles ***The following vehicles and equipages are used for transportation in Sweden:*** --*Truck max 3,5 tonnes* is mainly used for transportation of parcels. --*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic. --*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic. --*Truck, max 24 tonnes* is mainly used for transportation of general (styckegods) and wholesale (partigods) goods. --*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is *only used for Swedish domestic long-distance transport.* The vehicle is also permitted in Finland. --*Truck with semitrailer, max 42 tonnes* is used for international long-distance traffic. ***Utilisation level*** The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low. The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden): -excavated materials and round timber - 50% -manufactured products (wholesale goods) - slightly more than 20% -provisions and animal forage - approx. 15% -mixed cargo (general goods) approx - 10 %. ***The Swedish fleet*** The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories: After 1996: 10 % 95-92: 33% Before 1992 52 % The data was given by SIKA and SCB and concern vehicles larger than 3,5 tonnes. ***Bulky goods*** The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m3. The conversion factor is generally accepted in the transportation business. ***Fuel*** The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NOx emissions. Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. ''Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik'', Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.

	International road transports The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.
About Data	Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc. Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years. The data on emissions is largely based on tests on the engine performed in a laboratory according to a *standardised test cycle*. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions. A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute. The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).
Notes	The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se. The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998. The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives. The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

SPINE LCI dataset: Truck with semitrailer, max 42 tonnes, manufactured between 1992 and 1995 [Euro1]

Administrative	
Finished	Y
Date Completed	1997-11-19
Copyright	NGM (Nätverket för Godstransporter och Miljön)
Availability	This version is only available to the members of NTM. The data is continously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se.

Technical System	
Name	Truck with semitrailer, max 42 tonnes, manufactured between 1992 and 1995 [Euro1]
Functional Unit	1 tonkm, 70 %
Functional Unit Explanation	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if *empty trips are not included.*
Process Type	Unit operation
Site	Sweden

Sector	Land transport
Owner	Sweden
Technical system description	Operation of a diesel driven truck with semitrailer, with engine manufactured between 1992 and 1995 (Euro 1 environmental standard). The equipage is used for international long-distance traffic. Maximum gross weight: 42 tonnes. Kerb weight: 17 tonnes. Available loading capacity with regard to weight: 25 tonnes. Length: 18,5 metres.

System Boundaries

Nature Boundary	Regulated emissions to air are included. The parameters that are presented are: -regulated emissions for diesel engines: NOx, HC, particles and CO -fuel regulated: SO2 -tax regulated CO2. Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.
Time Boundary	The data represents trucks with engine manufactured between 1992 and 1995
Geographical Boundary	The data is based on Swedish conditions.
Other Boundaries	The average utilisation level is 70 % which is representative for Swedish domestic traffic if *empty trips are not included.* *Parameters not considered* -Driving technique -External conditions i.e. road conditions, climate etc. -Maintenance level of the vehicle *Excluded subsystems* -Exhaust emission control -Precombustion, i.e. production and distribution of the fuel -Maintenance of the vehicle -Erection and operation of infrastructure -After-treatment of the vehicle -Handling of production rests
Allocations	N/A
Systems Expansions	N/A

Flow Data

General Activity QMetaData

Date Conceived	1997-01-01
Data Type	Derived, unspecified
Represents	See 'Function'.
Method	The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The *quantity value for the energy use* refer to average fuel consumption, *the maximum and minimum value* refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For *emissions of NOx, HC, particles and CO, the quantity value* refer to an average engine guaranteed by Volvo Truck Corporation and the *maximum value* refer to the emission regulations for diesel engines according to the emission standard Euro I.

Applicability	The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out. ***Handling of goods*** Road transports generally consists of 1-3 routes: 1. Collection of the goods to terminal 2. Long-distance transport between terminals 3. Distribution of the goods from terminal The collection and distribution routes are generally performed by smaller vehicles --*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport. --*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited --*Parcel goods (<100 kg)* are normally handled in small vehicles ***The following vehicles and equipages are used for transportation in Sweden:*** --*Truck max 3,5 tonnes* is mainly used for transportation of parcels. --*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic. --*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic. --*Truck, max 24 tonnes* is mainly used for transportation of general (styckegods) and wholesale (partigods) goods. --*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is *only used for Swedish domestic long-distance transport*. The vehicle is also permitted in Finland. --*Truck with semitrailer, max 42 tonnes* is used for international long-distance traffic. ***Utilisation level*** The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low. The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden): -excavated materials and round timber - 50% -manufactured products (wholesale goods) - slightly more than 20% -provisions and animal forage - approx. 15% -mixed cargo (general goods) approx - 10 %. ***The Swedish fleet*** The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories: After 1996: 10 %

	95-92: 33% Before 1992 52 % The data was given by SIKA and SCB and concern vehicles larger than 3,5 tonnes. ***Bulky goods*** The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m3. The conversion factor is generally accepted in the transportation business. ***Fuel*** The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NOx emissions. Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. ''Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik'', Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions. ***International road transports*** The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.
About Data	Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc. Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years. The data on emissions is largely based on tests on the engine performed in a laboratory according to a *standardised test cycle*. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions. A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute. The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).
Notes	The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: http://www.ntm.a.se. The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998. The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives. The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

SPINE LCI dataset: Truck, long distance transportation

Administrative	
Finished	Y

Date Completed	1994-04-01
Copyright	
Availability	Public

Technical System

Name	Truck, long distance transportation
Functional Unit	tonkm, 50 %
Functional Unit Explanation	The energy use and exhaust emissions are calculated with reference to the transportation of 1 ton goods, 1 kilometre, with an utilisation level of 50%.
Process Type	Unit operation
Site	Sweden
Sector	Land transport
Owner	Sweden
Technical system description	Operation of heavy trucks and trailers with total gross weight 40-52 tonnes, used in long distance traffic. The available loading capacity with regard to weight is 25-32 tonnes.

System Boundaries

Nature Boundary	Emissions to air from combustion of the fuel are included. Other environmental impacts from the operation of the vehicle are not included.
Time Boundary	The aim was that the figures should represent the active fleet in 1992.
Geographical Boundary	Sweden and other countries with a similar fleet.
Other Boundaries	Utilisation level with regard to weight: 50%. *Excluded systems:* -Production and distribution of the fuel -Manufacture and maintenance of the vehicle -Establishment and maintenance of an infrastructure
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1985-1994
Data Type	Unspecified
Represents	See 'Function'.
Method	Data compiled from different literature sources. The emissions were calculated from emission factors; the emission factor for each specific substance was multiplied with the energy use. The emission factors were: SO2 0,0094 g/MJ NOx 0,9 g/MJ CO 0,34 g/MJ CO2 73,4 g/MJ HC 0,09 g/MJ Particles 0,1 g/MJ For details on how the emission factors and energy use were obtained, see metadata for each specific substance. Metadata for NOx, CO, CO2 and HC can be found under NOx
Literature Reference	Tillman, A-M. `Goods transportation in life cycle assessment. Standard values for energy consumption and emissions.` In: Life Cycle Assessment - Inventory Analysis Methodology: Overview, Recycling, Electricity and Transports, Swedish Waste Research Council (AFR) report nr 74, April 1995

Notes:	Input	Cargo	Cargo	1			tonne	Technosphere	
Date concieved: 1992 Data type: Unspecified Method: Simulation calculations conducted by AB Volvo of the energy use for heavy trucks and trailers with total weight 40-52 tonnes. Utilisation level with	Input	Refined resource	Diesel	0.9			MJ	Technosphere	

regard to weight: 50 %. The energy use are calculated as a mean value between the energy use at full load with regard to weight (25-32 tonnes) and the energy use at an empty transport. The simulations were conducted for the F12 and F16 Volvo models manufactured in 1987. The energy use for an empty truck varied between 0,26-0,31 litres/km, and at full load between 0,37-0,49 litres/km. The energy content in the fuel were 36,0 MJ/litre. Literature: de Val, D. `Schablonvärden för energiförbrukning vid godstransporter med lastbil.` Teknisk rapport, LM-54969, AB Volvo, Teknisk Utveckling, 1992 Notes: Simulation using diesel-driven Volvo trucks manufactured in 1987 was used with the aim that the values would represent an average value of the active fleets 1992. Note that the energy use for new trucks are lower. The values will therefore need to be updated regularly.

Notes:	Output	Emission	CO	0.31			g	Air	Sweden
Notes:	Output	Emission	CO2	66			g	Air	Sweden
Notes:	Output	Emission	HC	0.08			g	Air	Sweden
Date concieved: 1989-1993 Data type: Unspecified Method: The values are an average of emission factors (g/MJ) that were calculated from data found in Lenner, 1993. Emissions and energy use in Lenner were reported in g/tonkm and kWh/tonkm respectively (table 3, page 14) for two types of transports: • short distance (distribution) - an average value for 7-tonne and 14-tonne vehicles with an average load factor of 48% • long distance - 50-tonne truck with trailer with an average load factor of 60%. Emission factors in g/MJ were calculated by division of the emission factor (g/tonkm) with the energy use (kWh/tonkm) for the transport. A mean value of the calculated emission factors was then used. The figures stated by Lenner were calculated from data reported by Hammarström (1). The data in Hammarström (1) were based on measurements by the ECE R49 13-mode method, conducted by the engine exhaust laboratory of the Swedish Motor-Vehicle Inspection Co. The measurements can be found in Laveskog. The 13-mode method results in energy use and emissions in g/kWh, where kWh is related to the work done by the engine. Lenner has thus made corrections to these figures to make them represent a real traffic situation. The corrections were assumed to follow earlier relations between 13-mode data (g/kWh) and data representing a real traffic situation (g/km) described by Hammarström(2). Energy use and emissions in g/tonkm were obtained by division with the cargo weight (ton). About Inventory

Publication	Tillman, A-M. `Goods transportation in life cycle assessment. Standard values for energy consumption and emissions.` In: Life Cycle Assessment - Inventory Analysis Methodology: Overview, Recycling, Electricity and Transports, Swedish Waste Research Council (AFR) report nr 74, April 1995 -- Documentation and review of the report done by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology --
Intended User	LCA practitioners
General Purpose	To fulfil a need for standard values to calculate energy use and exhaust emissions from goods transports.
Detailed Purpose	To compile a set of standard values for energy use and exhaust emissions from available literature, and update standard values from an earlier investigation in: Tillman, A-M., Baumann, H., Eriksson, E., Rydberg, T. `Livscykelanalyser för förpackningsmaterial - beräkning av miljöbelastning` SOU 1991:77, Allmänna förlaget, Stockholm, 1991.
Commissioner	- .
Practitioner	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden .
Reviewer	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
Applicability	The data are only applicable for an utilisation level of 50 %, of the available loading capacity with regard to weight. This is a conservative assumption for the level of use. An utilisation level of 50 % is however fairly representative for long-distance transport in Sweden when empty return trips are included. The utilisation level has a large influence on the energy use and emissions per tonkm. The values are intended as an average of the active fleets in 1992. The data are only intended as standard values and should not be used for detailed study of transportation.
About Data	The emissions were calculated from the energy use and emission factors. The emission factors that were used, and the basis for them can be found under QmetaData for the entire dataset.

Availability	Public

Technical System	
Name	Turkey, electricity generation mix 1998
Functional Unit	Total electricity produced during 1998
Functional Unit Explanation	The electricity mix refer to the total amount of electricity generated by different power sources expressed in GWh during the year 1998.
Process Type	Unit operation
Site	Turkey
Sector	Energyware
Owner	Turkey
Technical system description	The generation of electricity with different power generating systems in Turkey during the year 1998.

System Boundaries	
Nature Boundary	Not applicable, since the data only refer to the electricity generation mix. The environmental load for generation of electricity is not included.
Time Boundary	The data refer to 1998.
Geographical Boundary	Only electricity produced in Australia is considered. Import or export of electricity is not included.
Other Boundaries	-
Allocations	Not applicable
Systems Expansions	Not applicable

Flow Data	
General Activity QMetaData	
Date Conceived	1998
Data Type	Derived, statistics
Represents	See 'Function'.
Method	The data are collected from IEA Statistics.

Intended User	LCA practitioners
General Purpose	The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.
Detailed Purpose	The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.
Commissioner	Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .
Practitioner	Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .
Reviewer	CPM -
Applicability	The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in ''Represents'' in QMetaData for each specific flow. When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations: - Biofuel electricity energy system, EPD-version - Fuel gas electricity energy system, EPD-version - Hydro electricity energy system, EPD-version - Lignite electricity energy system, EPD-version - Nuclear electricity energy system, EPD-version - Oil electricity energy system, EPD-version - Stone coal electricity energy system, EPD-version - Wind electricity energy system, EPD-version The following countries and regions have been documented in the database: Australia, electricity generation mix 1998 Austria, electricity generation mix 1998 Belgium, electricity generation mix 1998 Canada, electricity generation mix 1998 Czech Republic, electricity generation mix 1998 Denmark, electricity generation mix 1998 European Union, electricity generation mix 1998 Finland, electricity generation mix 1998 France, electricity generation mix 1998 Germany, electricity generation mix 1998 Greece, electricity generation mix 1998 Hungary, electricity generation mix 1998 Iceland, electricity generation mix 1998 Ireland, electricity generation mix 1998 Italy, electricity generation mix 1998 Japan, electricity generation mix 1998 Korea, electricity generation mix 1998 Luxembourg, electricity generation mix 1998

	Mexico, electricity generation mix 1998 Netherlands, electricity generation mix 1998 New Zealand, electricity generation mix 1998 Norway, electricity generation mix 1998 OECD Europe, electricity generation mix 1998 OECD North America, electricity generation mix 1998 OECD Pacific, electricity generation mix 1998 OECD total, electricity generation mix 1998 Poland, electricity generation mix 1998 Portugal, electricity generation mix 1998 Spain, electricity generation mix 1998 Sweden, electricity generation mix 1998 Switzerland, electricity generation mix 1998 Turkey, electricity generation mix 1998 United Kingdom, electricity generation mix 1998 United States, electricity generation mix 1998

SPINE LCI dataset: Turning of cast iron rings

Administrative	
Finished	Y
Date Completed	02-12-31
Copyright	
Availability	Public

Technical System	
Name	Turning of cast iron rings
Functional Unit	9,604 kg guide ring
Functional Unit Explanation	The guide ring used in the bearing 232/530 weighs 9,604 kg. Data for this activity regards turning from 33,75 kg down to 9,604 kg guide ring.
Process Type	Unit operation
Site	SKF Mekan ABBox 89 641 21 Katrineholm
Sector	Materials and components
Owner	SKF Mekan ABBox 89 641 21 Katrineholm
Technical system description	This activity describes a process step included in the whole system activity ''Production of guide rings used for spherical roller bearings'', also available in the SPINE@CPM database. The guide ring is manufactured at SKF Mekan AB in Katrineholm and the process consists of several steps. See the activity ''Production of guide rings used for spherical roller bearings'' for details. The guide ring will finally be mounted into the SKF Spherical Roller Bearing 232/530. The function of the guide ring is to assure that the rollers stay in the raceways of the bearing. The guide ring is made of cast iron, produced mainly from scrap. After smelting of the raw materal the smelt iron is casted in a sand form. The cast iron is then further processed into guide rings. This dataset describes the turning of the cast iron rings after the casting process. ------------------------- Turning of cast iron rings: The first step in the final treatment of the guide ring is turning. In this step the ring is turned to its final shape. Iron scrap is returned as raw material and reused in the smelting process.

System Boundaries

Nature Boundary	Many of the chemicals used in the turning process are not followed from the cradle, since it was too time consuming and the impact was assumed to be very small since the total amount was very small and the substances according to product data sheets not were considered hazardous. These inflows are considered non-elementary and come from the technosphere. The mineral oil in some of the chemicals were however taken into account, and the mineral oil were followed from the cradle with the activities: ''Extraction of crude oil'' and ''Refining of crude oil''. These activities are available in the SPINE@CPM database. Many outflows were considered non-elementary and were assumed to go to the technosphere, since it was too time consuming to follow them to the grave. The iron scrap from the turning process were considered a co-product since it will be used as raw material in the smelting process, and were not followed to the grave.
Time Boundary	The data was collected during the autumn 2002 and no changes in the procedure are planned for the nearest future.
Geographical Boundary	The turning operation takes place at SKF Mekan AB in Katrineholm, Sweden
Other Boundaries	The production of electricity is NOT included in this dataset, but must be followed from the cradle in order to obtain the total environmental impact.
Allocations	Allocations were made according to weight.
Systems Expansions	Not applicable

Flow Data

General Activity QMetaData

Date Conceived	02-08-01 - 02-12-31
Data Type	Monitored data, continuous
Represents	See 'Function'.
Method	Data has been gathered from interviews and supplied material from Marja Andersson, SKF Mekan AB, in Katrineholm. She is responsible for environmental questions and much of the data comes from the environmental report from year 2001. All product data sheets for the chemicals used in the process were supplied by Marja Andersson and thus the mineral oil in the different chemicals could be taken into account and followed from the cradle (extraction and refining of crude oil). The density for mineral oil were set to 0,8 g/cm3 (source: www.physics.uc.edu)
Literature Reference	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8, page II.300.
Notes	See ''Represents'' for each flow to see which power generation system that are used to generate the electricity.

Flow Table and Specific Meta Data

QMetaData	***Direction***	***FlowType***	***Substance***	***Quantity***	***Min***	***Max***	***Unit***	***Environment***	***Geography***
	Input	Refined resource	Electricity	5.5			kWh	Technosphere	Sweden
Date concieved: 02-08-01 - 02-12-31 Data type: Economical information Notes: APS 2 Grease consists of >95% mineral oil according to the product data sheet.	Input	Refined resource	Grease	0.0001055			kg	Technosphere	
Date concieved: 02-08-01 - 02-12-31 Data type: Economical information Notes: Hyspin AWS 46 contains >95 % mineral oil according to the product data sheet.	Input	Refined resource	Hyspin AWS 46	0.021			l	Technosphere	
	Input	Refined resource	Iron	33.75			kg	Technosphere	Sweden
Date concieved: 02-08-01 - 02-12-31 Data type: Economical information Notes: Magna BD 68 consists of >95% mineral oil according to the product data sheet.	Input	Refined resource	Magna BD 68	0.4219			l	Technosphere	
Date concieved: 2002 Data type: Calculated Method: All contents of mineral oil in the different chemicals were gathered into one figure so that this amount could be traced back to the cradle and be accounted for (extraction and refining of crude oil) The chemicals are still in the inventory list with the same amount, but	Input	Refined resource	mineral oil	0.3975			kg	Technosphere	

since the software LCAiT 4.0 has limitations, this was the best way to do. The substances are: Technical white (>95% mineral oil) Mgna BD 68 (>95% mineral oil) Hyspin AWS 46 (>95% mineral oil) APS 2 Grease (>95% mineral oil) The data from SKF Mekan was given in litres, and the density for mineral oil was set to 0,8 kg/l and so the weight of mineral oil could be calculated.

About Inventory

Publication	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ----------- Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.
Intended User	Product developers at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.
Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .

Practitioner	Helene Berg - .
Reviewer	Olle Ramnäs -
Applicability	The data is only valid for this specific guide ring (energy consumption), in the turning process at SKF Mekan AB, Katrineholm. Data for the chemicals used in this process is valid for casted iron processed in the same turning process at this specific site.
About Data	Data is gathered from interviews with Marja Andersson, SKF Mekan AB, Katrineholm.
Notes	

SPINE LCI dataset: Turning of steel bars into bearing rollers

Administrative	
Finished	Y
Date Completed	02-12-31
Copyright	
Availability	Public

Technical System	
Name	Turning of steel bars into bearing rollers
Functional Unit	One turned roller: 11,44 kg
Functional Unit Explanation	For the manufacturing of one bearing roller, one turned roller is needed. The turned rollers weighs 11,44 kg. One SKF spherical roller bearing 232/530 consists of following components: 1. one inner ring 2. one outer ring 3. one guide ring 4. one brass cage 5. 36 bearing rollers (coated or non-coated)
Process Type	Unit operation
Site	SKF Sverige AB415 50 GÖTEBORG
Sector	Materials and components
Owner	SKF Sverige AB415 50 GÖTEBORG
Technical system description	This activity describes a process step included in the system ''Production of bearing rollers (à 9,2 kg)'', also available in the SPINE@CPM database. Cut steel bars (117*147 mm) from Kode, Sweden are further processed at SKFs site in Göteborg. In this activity the cut steel bars are turned in the SMT lathe into desired shape. The steel scrap is sent to Ovako Steel AB in Hofors by train, but the transport and recycling activities are NOT included in this dataset, but in the complete system: ''Production of bearing rollers à 9,2 kg''(can be found in the SPINE@CPM database) The turned rollers are after this activity sent for heat treatment and then for grinding and polishing, before they finally are mounted into the SKF spherical roller bearing 232/530.

System Boundaries	
Nature Boundary	Emissions to air are not measured and could therefore not be reported in this study. Emissions to water and the use of cutting fluid at SKF, Göteborg, could according to allocation difficulties and lack of time not be calculated. The steel scrap from the process at SKF, Göteborg is sent to Ovako Steel in Hofors for recycling and is therefore not seen as waste, but a co-product to the technosphere.
Time Boundary	The data was collected during the autumn 2002.

Geographical Boundary	The process is site specific for SKF in Göteborg, Sweden.
Other Boundaries	The electricity production is NOT included in this dataset, but must be accounted for to get the complete environmental impact. The impact from the production and disposal of the cutting fluid is not included in this dataset, since no data was available.
Allocations	Energy consumption depends on how long the rollers is processed in the different process equipment. This varies according to weight, but also according to size and desired properties of the final product.
Systems Expansions	Not applicable

Technical System	
Name	Turning of steel rings at SKFs site in Göteborg
Functional Unit	Turned steel rings, 858.5 kg
Functional Unit Explanation	'Turned steel rings' includes one turned outer ring 232/530 OR and one turned inner ring 232/530 One turned outer ring and one turned inner ring weigh together 858,5 kg. The rings will finally be processed into bearing rings used for the SKF spherical roller bearing 232/530
Process Type	Unit operation
Site	SKF Large Bearings
Sector	Materials and components
Owner	SKF Large Bearings
Technical system description	This activity is a process step included in the system ''Production of bearing rings'', also available in the SPINE@CPM database. Turning of steel rings at SKFs site in Göteborg: The rings from Ovako Steel AB are treated further at the SKF production plant in Göteborg. The ring processes at SKF can be divided into three main steps: 1. Soft treatment 2. Hardening 3. Hard treatment For large sized bearings more work is done by hand and a smaller quantity is produced. The soft treatment starts with TURNING for both rings. The rings are turned into their final shape. For the outer ring this also means that a channel with holes for lubrication is made. For the SRB 232/530 the turning process takes place at the C-factory in production channel 23 for both rings. After the turning both the rings are inspected by ultra sound. This is done for 100% of the rings of this dimension. The reason is to make sure that the material is solid and homogenous through the whole ring. If a crack would be discovered the whole ring will be scrapped. This dataset describes the turning process. Only the amount of material is considered. The electricity consumption for the turning machine and the consumption of cutting fluid are put together with the other ring processing step at SKFs site in Göteborg and reported in the activity ''Ring processes at SKFs site in Göteborg''. The rings will be further processed in the activities: ''Heat treatment of bearing rings'' and ''Ring processes at SKFs site in Göteborg''. These activities are available in the SPINE@CPM database.

System Boundaries	
Nature Boundary	Emissions to air and water are not measured and could therefore not be reported in this study. The steel scrap from the process at SKF, Göteborg is sent to Ovako Steel in Hofors for recycling and is therefore not seen as waste, but a co-product to the technosphere.

About Inventory	
Publication	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8. -- Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden --
Intended User	LCA practitioners
General Purpose	The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.
Detailed Purpose	The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.
Commissioner	Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .
Practitioner	Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .
Reviewer	CPM -
Applicability	The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in ''Represents'' in QMetaData for each specific flow. When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations: - Biofuel electricity energy system, EPD-version - Fuel gas electricity energy system, EPD-version - Hydro electricity energy system, EPD-version - Lignite electricity energy system, EPD-version - Nuclear electricity energy system, EPD-version - Oil electricity energy system, EPD-version - Stone coal electricity energy system, EPD-version - Wind electricity energy system, EPD-version The following countries and regions have been documented in the database: Australia, electricity generation mix 1998 Austria, electricity generation mix 1998 Belgium, electricity generation mix 1998 Canada, electricity generation mix 1998 Czech Republic, electricity generation mix 1998 Denmark, electricity generation mix 1998 European Union, electricity generation mix 1998 Finland, electricity generation mix 1998 France, electricity generation mix 1998 Germany, electricity generation mix 1998 Greece, electricity generation mix 1998 Hungary, electricity generation mix 1998 Iceland, electricity generation mix 1998 Ireland, electricity generation mix 1998

	Italy, electricity generation mix 1998 Japan, electricity generation mix 1998 Korea, electricity generation mix 1998 Luxembourg, electricity generation mix 1998 Mexico, electricity generation mix 1998 Netherlands, electricity generation mix 1998 New Zealand, electricity generation mix 1998 Norway, electricity generation mix 1998 OECD Europe, electricity generation mix 1998 OECD North America, electricity generation mix 1998 OECD Pacific, electricity generation mix 1998 OECD total, electricity generation mix 1998 Poland, electricity generation mix 1998 Portugal, electricity generation mix 1998 Spain, electricity generation mix 1998 Sweden, electricity generation mix 1998 Switzerland, electricity generation mix 1998 Turkey, electricity generation mix 1998 United Kingdom, electricity generation mix 1998 United States, electricity generation mix 1998

About Inventory

Publication	This process is included in the system described in: Kilgus D, 2005, Life cycle assessment of a demonstration project - vehicle use of hydrogen-blended natural gas. Environmental Systems Analysis report 2005:16, Chalmers University of Technology, Gothenburg, Sweden Link to pdf (in Swedish): http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--16.pdf
Intended User	LCA practitioners.
General Purpose	This data set is included in a master thesis. Excerpt from the master thesis abstract: ''Hydrogen is often considered as the way out of the environmental and economical problems associated with the use of fossil fuels. However, one of the main implementation barriers is the missing infrastructure. The introduction of hydrogen-blended compressed natural gas (HCNG) as a fuel for natural gas vehicles could serve as a bridging technology by using the existing natural gas infrastructure for the distribution of hydrogen.''
Detailed Purpose	Excerpt from the master thesis abstract: ''The purpose of this thesis is to assess and compare the environmental aspects of using natural gas, HCNG with 15% and 30% hydrogen by volume, and hydrogen as vehicle fuels within the scope of the proposed demonstration project.''

	Excerpt from the report (see 'Publication'): ''Since 2001, the Arizona Public Service (APS), in cooperation with Electric Transportation Applications (ETA) and the U.S. Department of Energy's Advanced Vehicle Testing Activity (ATVA), has tested different vehicles operated on CNG, HCNG and hydrogen.''

SPINE LCI dataset: Use of bearing at a paper mill

Administrative	
Finished	Y
Date Completed	2002-12-01
Copyright	
Availability	Public

Technical System	
Name	Use of bearing at a paper mill
Functional Unit	0.13 ton of bearing
Functional Unit Explanation	The function is that of a bearing at its place in the paper machine during one year. One SKF spherical roller bearing 232/530 weighs 1.2 ton. It is used for 9 years so the annual use is 0.13 ton of bearing.
Process Type	Unit operation
Site	Stora Enso Hylte ABHylte Mill S- 314 81 HYLTEBRUK Sweden
Sector	Process
Owner	Stora Enso Hylte ABHylte Mill S- 314 81 HYLTEBRUK Sweden
Technical system description	This activity describes the use of bearing at a paper mill. The bearing is used in the soft calender sector of a paper machine. One bearing 232/530 weighs 1.2 tons. It is replaced every ninth year, which means that if allocation is done by weight, 0.13 tons of bearings are therefore consumed per year. Speed: 1100 meters/minute.The bearing is lubricated with circulating oil, Mobil DTE PM 220. The lubricant is circulated at a speed of 8 liters/minute.

System Boundaries	
Nature Boundary	The inflows as well as the outflows come from the technosphere.
Time Boundary	Data is collected during autumn 2002.
Geographical Boundary	The data is case specific for Storaenso, Hyltebruk, Sweden
Other Boundaries	The energy consumption included derives from the pumping of oil in the lubricating system. The energy used to drive the roll of the paper machine (that the bearing is mounted on is not included. It was not interesting in our study since most of the friction was created from the oil surplus, and was the same in both cases.
Allocations	All in- and outflows are divided with the time period they are in use, i e lifetime. The consumption/emissions are all for the period of one year and for one bearing.
Systems Expansions	Not applicable

Flow Data

About Inventory

Publication	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Thechnology, December 2002. -------------------- Data documented by Sandra Häggström, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-03-21.
Intended User	Product developer at SKF.
General Purpose	The data documentation is accomplished as a part of the thesis work ''LCA-based solution selection'', performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
Detailed Purpose	The purpose for our study is to compare a coated roller bearing to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll and is lubricated with a circulating oil system in both cases.

Commissioner	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
Practitioner	Sandra Häggström - .
Reviewer	Olle Ramnäs -
Applicability	The data is applicable for bearings used in the soft calender in a paper machine.
About Data	The data is gathered interviewing Dan Hedin on a visit at Storaenso, Hyltebruk.
Notes	

SPINE LCI dataset: Use phase of train bearings - train type 'Regina'. ESA-DBP

Administrative	
Finished	Y
Date Completed	2003
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Use phase of train bearings - train type 'Regina'. ESA-DBP
Functional Unit	2 axleboxes with bearings on a distance of 100 000km
Functional Unit Explanation	Excerpt from the report, see 'Publication': ''The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. The functional unit (fu) is here defined as 2 axleboxes with bearings, mounted on a wheel axle in use on its matched Electric Multiple Unit (EMU) during 100 000 km of transport. (...) For the calculations a maintenance interval of 500 000 km is assumed for the bearings, which implies maintenance every fifth year if the EMUs are run 100 000 km per year.''
Process Type	Gate to gate
Site	SKF Sverige AB 415 50 Göteborg
Sector	Land transport
Owner	SKF Sverige AB 415 50 Göteborg
Technical system description	The study was done for a a train 'Regina' which is manufactured by Adtranz, today Bombardier Transportation, since the year 2000. In this kind of train pre-lubricated, sealed Tapered Bearing Units, so-called TBUs are used. The Reginas are used on the Swedish West coast, in Mälardalen and in Bergslagen. Excerpt from the study, see 'Publication': ''The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. (...) The Regina TBU is named 1639605 C and contains the bearing BT2B 641157 CB. The axlebox has the number 432758. (...) In this study, the use-phase of train bearings involves the time the bearings are in operation on an EMU (NB: Electric Multiple Unit) wheel axle and the processes for wheel axle refurbishment when needed. (...) The main processes discussed in the study are production, operation, maintenance and transports of train bearings. For the maintenance process, there is a number of sub-processes called dismounting of wheel axle, detergent production, naphtha production, lubricating oil and grease production, local processes, and waste oil handling. Local processes denote electricity use of tools and machines at the refurbishment site. For Regina, the TBU is filled with grease and sealed at the SKF factory and no grease is added when the TBU and the axlebox are mounted on the axle. (...) If there is no leakage from the axlebox, the only environmental impact caused by train bearings in operation is related to noise, vibration and energy use because of friction between bearing parts. The consequences of the energy use depend on the energy source, which is electricity for all EMUs. (...) For maintenance of train bearings, the wheel axle is dismounted from the train car, and the axlebox and the bearings are dismounted from the axle. The different parts are cleaned, washed, refurbished, relubricated and finally

	remounted on the axle. The environmental impact of these activities, and the transports between them, is related to the use of electricity, detergents and oil products, and the discharge of greenhouse gases, toxic material and polluting substances.'' This process is included in the system described in: Jonasson K., Environmental Aspects of the Use-Phase for Bearings in Trains. Environmental Systems Analysis, Report 2003:3, ISSN 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf Other processes in the CPM Database also included in the above publication: - Operation on train bearings - train type 'X1'. ESA-DBP - Operation on train bearings - train type 'X10'. ESA-DBP - Operation on train bearings - train type 'Regina'. ESA-DBP - Maintenance of train bearings - train type 'X1'. ESA-DBP - Maintenance of train bearings - train type 'X10'. ESA-DBP - Maintenance of train bearings - train type 'Regina'. ESA-DBP - Use phase of train bearings - train type 'X1'. ESA-DBP - Use phase of train bearings - train type 'X10'. ESA-DBP

System Boundaries

Nature Boundary	Excerpt from the report, see 'Publication': ''The environmental impact of the whole life cycle, from cradle to grave, for products used during the use-phase of the bearings is thus included, while production and recycling of bearings, and distribution of new and discarded bearings are not. (...) The one environmental aspect considered for train bearings in operation is electricity use. (...) Land, water and other types of resource use could not be assessed, due to lack of data.''
Time Boundary	Excerpt from the report, see 'Publication': ''The study is intended to illustrate the present situation, and the qualitative and quantitative information for the main processes are from the year 2001 until today. (NB: the report was written in 2003)
Geographical Boundary	Excerpt from the report, see 'Publication': ''All the studied trains are in use in Sweden, where most of the maintenance is performed, too. (...) The operation and maintenance processes were mapped with regard to the specific sub-processes at the Swedish and Italian sites.
Other Boundaries	Excerpt from the report, see 'Publication': ''The mass of passengers is neglected, but corresponds to roughly 10 percent of the duty mass if the train is half-filled. The ambient temperature used in the calculations was 10 degrees centigrade. Noise and vibration were not studied, and other environmental aspects of railway traffic operation were not regarded as being clearly related to the use of bearings. The environmental effects of industrial buildings, production of tools and machines, and the use of human labour are not included. (...) The lifetime of train bearings is not included in the study, as this primarily would affect the environmental impact of the production-phase in that a differing number of bearings would be needed to maintain the same function. It is thus included in the production-phase in the comparison with the operation, maintenance and transports processes. The lifetime of bearings is generally given as basic rating life (L10h), which is 'the life that 90 percent of a sufficiently large group of apparently identical bearings can be expected to attain or exceed'.''

About Data	ESA database project. Years 2009-2011. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: The Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	Excerpt from the report, see 'Publication': ''SKF provides both bearings and bearing housings for trains, called axleboxes, which are mounted in direct connection with the train's wheels to make the wheel axle able to rotate (...). The bearings used for this purpose are in this study referred to as 'train bearings', even though there are other fields of application for bearings in trains (e.g. in the traction system). What type of rolling bearings used for the wheel axle varies according to performance needs and train design, but the function is essentially the same.''

Technical System	
Name	Use phase of train bearings - train type 'X1'. ESA-DBP
Functional Unit	2 axleboxes with bearings on a distance of 100 000km
Functional Unit Explanation	Excerpt from the report, see 'Publication': ''The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. The functional unit (fu) is here defined as 2 axleboxes with bearings, mounted on a wheel axle in use on its matched Electric Multiple Unit (EMU) during 100 000 km of transport. (...) For the calculations a maintenance interval of 500 000 km is assumed for the bearings, which implies maintenance every fifth year if the EMUs are run 100 000 km per year.''
Process Type	Gate to gate
Site	SKF Sverige AB 415 50 Göteborg
Sector	Land transport
Owner	SKF Sverige AB 415 50 Göteborg
Technical system description	The study was done for a a train 'X1' which was manufactured by ASEA during the years 1967-1975. In this kind of train an un-sealed Spherical Roller Bearings (SRBs) were used. More than 100 of X1s were produced and most of them are still in use especially in Stokholm area. Excerpt from the study, see 'Publication': ''The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. (...) The SRB used in X1-A, X1-B and X10 has the SKF product number 23226 CC/C3W33, and the axleboxes are called 723724, 723721 and 4000850 respectively. (...) In this study, the use-phase of train bearings involves the time the bearings are in operation on an EMU (NB: Electric Multiple Unit) wheel axle and the processes for wheel axle refurbishment when needed. (...) The main processes discussed in the study are production, operation, maintenance and transports of train bearings. For the maintenance process, there is a number of sub-processes called dismounting of wheel axle, detergent production, naphtha production, lubricating oil and grease production, local processes, and waste oil handling. Local processes denote electricity use of tools and machines at the refurbishment site. When mounted on a X1 (...), the axlebox with its one or two bearings is filled with grease and sealed, to keep the grease inside and water and dirt outside the box. Thus no lubrication is needed while the bearing is in operation, and the axlebox is only opened when the whole wheel axle is dismounted for maintenance. If there is no leakage from the axlebox, the only environmental impact caused by train bearings in operation is related to noise, vibration and energy use because of friction between bearing parts. The consequences of the energy use depend on the energy source, which is electricity for all EMUs. (...) For maintenance of train bearings, the wheel axle is dismounted from the train car, and the axlebox and the bearings are dismounted from the axle. The different parts are cleaned, washed, refurbished, relubricated and finally remounted on the axle. The environmental impact of these activities, and the transports between them, is related to the use of electricity, detergents and oil products, and the discharge of greenhouse gases, toxic material and polluting substances. This process is included in the system described in: Jonasson K., Environmental Aspects of the Use-Phase for Bearings in Trains. Environmental Systems Analysis, Report 2003:3, ISSN 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF:

Technical System	
Name	Use phase of train bearings - train type 'X10'. ESA-DBP
Functional Unit	2 axleboxes with bearings on a distance of 100 000km
Functional Unit Explanation	Excerpt from the report, see 'Publication': ''The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. The functional unit (fu) is here defined as 2 axleboxes with bearings, mounted on a wheel axle in use on its matched Electric Multiple Unit (EMU) during 100 000 km of transport. (...) For the calculations a maintenance interval of 500 000 km is assumed for the bearings, which implies maintenance every fifth year if the EMUs are run 100 000 km per year.''
Process Type	Gate to gate
Site	SKF Sverige AB 415 50 Göteborg
Sector	Land transport
Owner	SKF Sverige AB 415 50 Göteborg
Technical system description	The study was done for a a train 'X10' which was manufactured by ASEA/ABB Traction during the years 1982-1993. In this kind of train an un-sealed Spherical Roller Bearings (SRBs) were used. More than 100 of X10s were produced and most of them are still in use especially in Stokholm, Gotheburg and Skåne area. Excerpt from the study, see 'Publication': ''During the 1990s some of the X10s were rebuilt with a different interior, and renamed to X11. These are also included under the designation X10 in this study, as the basic performance is the same. (...) The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. (...) The SRB used in X1-A, X1-B and X10 has the SKF product number 23226 CC/C3W33, and the axleboxes are called 723724, 723721 and 4000850 respectively. (...) In this study, the use-phase of train bearings involves the time the bearings are in operation on an EMU (NB: Electric Multiple Unit) wheel axle and the processes for wheel axle refurbishment when needed. (...) The main processes discussed in the study are production, operation, maintenance and transports of train bearings. For the maintenance process, there is a number of sub-processes called dismounting of wheel axle, detergent production, naphtha production, lubricating oil and grease production, local processes, and waste oil handling. Local processes denote electricity use of tools and machines at the refurbishment site. When mounted on a X10 (...), the axlebox with its one or two bearings is filled with grease and sealed, to keep the grease inside and water and dirt outside the box. Thus no lubrication is needed while the bearing is in operation, and the axlebox is only opened when the whole wheel axle is dismounted for maintenance. If there is no leakage from the axlebox, the only environmental impact caused by train bearings in operation is related to noise, vibration and energy use because of friction between bearing parts. The consequences of the energy use depend on the energy source, which is electricity for all EMUs. (...) For maintenance of train bearings, the wheel axle is dismounted from the train car, and the axlebox and the bearings are dismounted from the axle. The different parts are cleaned, washed, refurbished, relubricated and finally remounted on the axle. The environmental impact of these activities, and the transports between them, is related to the use of electricity, detergents and oil products, and the discharge of greenhouse gases, toxic material and polluting substances.'' This process is included in the system described in: Jonasson K., Environmental Aspects of the Use-Phase for Bearings in Trains. Environmental Systems Analysis, Report 2003:3, ISSN 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf Other processes in the CPM Database also included in the above publication: - Operation on train bearings - train type 'X1'. ESA-DBP - Operation on train bearings - train type 'X10'. ESA-DBP

	- Operation on train bearings - train type 'Regina'. ESA-DBP - Maintenance of train bearings - train type 'X1'. ESA-DBP - Maintenance of train bearings - train type 'X10'. System Boundaries

Nature Boundary	Excerpt from the report, see 'Publication': "The environmental impact of the whole life cycle, from cradle to grave, for products used during the use-phase of the bearings is thus included, while production and recycling of bearings, and distribution of new and discarded bearings are not. (...) The one environmental aspect considered for train bearings in operation is electricity use. (...) Land, water and other types of resource use could not be assessed, due to lack of data."
Time Boundary	Excerpt from the report, see 'Publication': "The study is intended to illustrate the present situation, and the qualitative and quantitative information for the main processes are from the year 2001 until today. (NB: the report was written in 2003)
Geographical Boundary	Excerpt from the report, see 'Publication': "All the studied trains are in use in Sweden, where most of the maintenance is performed, too. (...) The operation and maintenance processes were mapped with regard to the specific sub-processes at the Swedish and Italian sites.
Other Boundaries	Excerpt from the report, see 'Publication': "The mass of passengers is neglected, but corresponds to roughly 10 percent of the duty mass if the train is half-filled. The ambient temperature used in the calculations was 10 degrees centigrade. Noise and vibration were not studied, and other environmental aspects of railway traffic operation were not regarded as being clearly related to the use of bearings. The environmental effects of industrial buildings, production of tools and machines, and the use of human labour are not included. (...) The lifetime of train bearings is not included in the study, as this primarily would affect the environmental impact of the production-phase in that a differing number of bearings would be needed to maintain the same function. It is thus included in the production-phase in the comparison with the operation, maintenance and transports processes. The lifetime of bearings is generally given as basic rating life (L10h), which is 'the life that 90 percent of a sufficiently large group of apparently identical bearings can be expected to attain or exceed'."
Allocations	Unknown
Systems Expansions	Not applicable

Flow Data

General Activity QMetaData

Date Conceived	2002
Data Type	Derived, unspecified
Represents	See 'Function'
Method	Excerpt from the report, see 'Publication': "The data has been collected through visits and interviews. (...) Most data are estimates made by responsible personnel at the different sites, as there seldom is any information available, that is detailed enough for the purpose of an LCA. The estimates are combined with data from product data sheets and published LCA literature, to give a realistic approximation of the actual conditions. The electricity use for train bearings in operation was calculated with the computer program SKF Galaxy."

Technical System	
Name	Wafer production, for photovoltaic cells. ESA-DBP
Functional Unit	1 m2 of monocrystalline module
Functional Unit Explanation	The EG Si wafers are processed into solar cells and the cells are combined into monocrystalline modules. Due to wafer shaping 1.11m2 of wafer is needed per 1m2 module.
Process Type	Cradle to gate
Site	Not applicable
Sector	Materials and components
Owner	Not applicable
Technical system description	Production of EG Si (= electronic grade polycrystalline silicon) wafers: ''Figure 5 (page 12 in the report, see report link below) shows the principal steps in processing silicon to make wafers for cell production. As quartz is a common substance on earth and easy to mine, energy use in raw material extraction is assumed small and neglected from calculations. Metallurgical grade silicon (MG-Si) is produced from quartz (SiO2) in a large furnace. Coal is commonly used for reduction, a process that emits CO2. MG-Si is converted to trichlorosilane (SiHCl3) by the ''Siemens method'', which reacts with H2 in a large electric furnace producing electronic grade (EG-Si) polycrystalline silicon. No losses are mentioned for the Siemens process in the literature, which could be a false assumption. This is molten in a big pot, a crucible, in which a monocrystalline seed is planted. A monocrystal ingot grows around the seed and is slowly pulled out and cooled with a Czochralski (Cz) process. 28% material losses are assumed. The ingot is sliced into roughly 300 ¹m wafers with a multi-wire saw. Further 10% losses are assumed in wafer shaping.'' This process is included in the system described in ''Suomalainen K, 2006, Environmental life cycle assessment of a large-scale grid-connected PV power plant. Environmental Systems Analysis report 2006:14, Chalmers University of Technology, Gothenburg, Sweden'' at http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2006--14.pdf

System Boundaries	
Nature Boundary	''As quartz is a common substance on earth and easy to mine, energy use in raw material extraction is assumed small and neglected from calculations.''
Time Boundary	Unknown. The importer of data to CPMDatabase makes a qualified guess that the average year of data is year 2000, based on the publication years of the literature references that are referred to in the report.
Geographical Boundary	The wafer production takes place in Spain, Europe. There is no comment on where raw material acquisition is done, however as stated in the report: ''As often site-specific information is unavailable, national or European statistics are used and accordingly stated.''
Other Boundaries	28% material losses are assumed in the Czochralski (Cz) process. 10% losses are assumed in wafer shaping.
Allocations	Not applicable.
Systems Expansions	Not applicable.

Flow Data	
General Activity QMetaData	
Date Conceived	Not applicable.
Data Type	Derived, mixed
Represents	Not applicable.

Method	Data is collected primarily from existing LCAs for raw material production, component manufacturers - environmental reports or correspondence via email - and project managers. As often site-specific information is unavailable, national or European statistics are used and accordingly stated.

Notes: This value is calculated from other values in the literature reference, by the importer of data. For every Substance the total weight for the whole 62 MW PV installation is given in kg. The total wafer area for the whole installation is also given. By multiplying the weight of substance per m2 module with the total area of wafer per installation and then dividing this with the total weight of substance per installation the value 1.11 m2 wafer per m2 module area is given.	Output	Product	wafer	1.11			m2	Technosphere

General Purpose	Master Thesis Report
Detailed Purpose	''Concern for the environment and the threat of uncontrollable catastrophes has caused people around the world to reconsider their daily choices. Individuals, communities and governments are taking actions against global warming; be it choosing a bike over a car, investing in hydrogen buses or building the world's largest solar photovoltaic power plant.'' This thesis presents a systematically performed life cycle assessment of that power plant, and explores the environmental impacts of scaling up the use of this technology. Consistent with the EU directive on renewable electricity (2001/77/CE) Portugal has the aim to deliver 39 percent (including large hydro) of its gross electricity consumption in 2010 from renewable energy sources. In 2003 the government defined a new energy policy framework in

	which one of the three main strategic points is to promote sustainable development by supporting the development of renewable energy resources and improving energy efficiency, in order to meet the Kyoto Protocol commitment. Two of the most ambitious targets for 2010 regard generation of wind power, increasing from the currently installed capacity of 900 MW to 3750 MW, and photovoltaics, increasing from 2 MWp to 150 MWp.

Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.
About Data	''For data on emissions from processes, an earlier life cycle inventory on monocrystalline silicon wafer production is used. This data includes a total aggregated inventory for the production of wafers; raw materials, primary energy requirements as well as emissions to air, water and soil are given per wafer. In this study only the emissions from processes are used i.e. emissions from electricity use are calculated separately and subtracted from this data. The CO2 emissions from the reduction in metallurgical grade silicon production is calculated as two carbon atoms per one silicon atom. Also the amount of coal used in this process is calculated by the same principle.'' ''Energy data is retrieved from existing studies and shown in the flowchart under 'Function' for the various steps. Reduction of SiO2 to MG-Si takes 12 kWhe/kgSiMG. For the Siemens process 83 kWhe/kgSiEG is used. For ingot growth 40 kWhe/kgSiCz is assumed and wafer slicing is assumed to require 19 kWhe/m2 wafer.'' Availability	Public.

Technical System	
Name	Waste collection vehicle, diesel driven. ESA-DBP
Functional Unit	one metric ton of collected waste
Functional Unit Explanation	Collecting and transporting one ton of waste in Gothenburg city.
Process Type	Cradle to grave
Site	Gothenburg, Sweden
Sector	Sector
Owner	Gothenburg, Sweden
Technical system description	Excerpts from the report (for report see link below): ''2.2.1 Options Three types of waste collection vehicles were compared:

	· A diesel waste collection vehicle · A gas waste collection vehicle · A gas-electric hybrid waste collection vehicle (..) The vehicles are back-loading waste collection vehicles, used mainly for collection of municipal waste. The gas and diesel vehicles use the combustion engines both when they run and when they load waste (...) The vehicles consist of a truck chassis from Volvo AB, model FL6E, and a waste collection unit, i.e. the container and waste loading equipment on the truck, from Norba AB, model RL 200L.'' ''When a waste collection vehicle stops to collect waste, the combustion engine is kept running and is used to lift the waste into the truck and to compact it. This also means that the vehicle idles for a considerable amount of time when the workers collect waste bins, emitting pollutants without doing any work. The collection is often also considered noisy by people in the vicinity. According to measurements at Renova, the time a waste collection vehicle stands still accounts for about 60 percent of the total working time when operating in the central parts of Gothenburg (Österman, 2002). In 2002, Renova, together with Volvo AB, Norba AB and ETP AB, started to develop a vehicle that uses natural gas when running, but automatically turns the combustion engine off when it has stopped and uses electricity to load and compact the waste. Using this technique reduces air emissions and noise in the vicinity of the collection sites.'' Figure 5 in the report shows a flow chart of the life cycle of the vehicles. Some facts about the diesel (and gas) vehicle (Table 1 in the report): Truck model: Volvo FL6E Waste collection unit model: Norba RL 200L Manufacturing year: 2001 Service Weight: 10 720 kg Loading capacity: 7 280 kg Engine power: 162 kW Emissions control: Catalytic converter and CRT particle filter This process is included in the system described in Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. Environmental Systems Analysis report 2005:7, Chalmers University of Technology, Gothenburg, Sweden at http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--7.pdf Other processes in the CPM Database also included in the above publication: Truck chassi manufacturing. ESA-DBP Truck tire production. ESA-DBP Transportation with diesel driven waste collection vehicle. ESA-DBP Transportation with gas driven waste collection vehicle. ESA-DBP Collection stop, with hybrid (gas-electric driven) waste collection vehicle. ESA-DBP Waste collection vehicle, driven by compressed natural gas. ESA-DBP Waste collection vehicle, driven by electricity and compressed natural gas. ESA-DBP

System Boundaries	
Nature Boundary	Excerpt from the report (for report see 'Publication'): ''The LCA covers all of the life cycle of the waste collection vehicles from the cradle, when raw materials are extracted, to the grave, end-of-life treatment of the used vehicle.''
Time Boundary	Excerpt from the report (for report see 'Publication'): ''The assessment focuses on the technical system of today with a few years' perspective; data from the recent years were used, and the lifetime of a vehicle was assumed to be ten years.'' NB: The report is written in 2004 and 2005.
Geographical Boundary	The study is limited to waste collection in central Gothenburg, Sweden.
Other Boundaries	Excerpts from the report (for report see 'Publication'): ''The LCA covers all of the life cycle of the waste collection vehicles from the cradle, when raw materials are extracted, to the grave, end-of-life treatment of the used vehicle. Maintenance and repair was also accounted for. Concerning the end-of-life treatment, sorting into different material fractions was included whereas re-melting to produce another product was allocated to the new product, thus not accounted for.'' NB: The waste treatment (e.g. burning) of the collected waste was not included in the life cycle of the waste collection vehicle. ''Environmental impacts from the manufacturing of capital goods, such as machines used in the manufacturing of the vehicles, were not considered, nor were impacts from

	activities of employees.'' ''The study is limited to waste collection in central Gothenburg, using a Volvo chassis of model FL6E with a Norba waste collection unit of model RL 200L. The gas vehicles were assumed to use natural gas (not biogas). Environmental impacts from noise or odour were not considered.''
Allocations	Excerpts from the report (for report see 'Publication'): ''Concerning the end-of-life treatment, sorting into different material fractions was included whereas re-melting to produce another product was allocated to the new product, thus not accounted for.'' ''Allocations in material production were mainly based on weight and in vehicle manufacturing processes, on number of products.'' ''Most of the disassembled parts are transported to the fragmentation facility at Stena fragmentering AB in Halmstad, Sweden. The facility treats a wide variety of scraps, of which about one third is vehicle scrap (Stena fragmentering AB, 2005). Stena fragmentises and sorts the scrap into separate material fractions. Allocation of environmental impacts was based on weight of the unsorted scrap input to the facility. The amount of sorted scrap from a vehicle out from the fragmentation facility was calculated from the total amount of metals in the vehicle and multiplying this by the degree of recycling. The total amount of sorted scrap from the facility was 137 930 tons. The total amount of the residuals including metals that could not be sorted out was 52 928 tons (Stena fragmentering AB, 2005) and the metal fraction in the residuals was 8% (Eskilsson, 2002). This gave the degree of recycling for metals: 137 930 / (137 930+52 928·0.08) = 97%''
Systems Expansions	Excerpt from the report (for report see 'Publication'): ''A few system expansions were used to account for excess energy produced in some processes.''

Flow Data

General Activity QMetaData

Date Conceived	2004
Data Type	Derived, mixed
Represents	See 'Function'.
Method	Excerpt from the report: ''2.3.2 Data collection From the use phase, data from direct measurements carried out at Renova of the studied vehicles were available. Also for the maintenance and repair, data from Renova were used. Data concerning production and end-of-life treatment were collected by personal communication, from annual environmental reports and from previous life cycle assessment reports. The main calculations were carried out in the LCA software LCAiT (CIT Ekologik, 2003), where some general data also were included.'' NB: Chapter 2.3.2 is a chapter in the report. The reference (CIT Ekologik, 2003) can be found in the report.
Literature Reference	Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. About Inventory

Publication	Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. Environmental Systems Analysis report 2005:7, Chalmers University of Technology, Gothenburg, Sweden http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--7.pdf
Intended User	Renova AB and LCA practitioners
General Purpose	Excerpt from the report (for report see Publication): ''The waste and recycling company Renova AB has developed a new type of waste collection vehicle, which has been used and evaluated for waste collection in central Gothenburg for a few years. What distinguishes this type of vehicle from conventional waste collection vehicles is, firstly, that it uses natural gas to drive instead of diesel, and secondly, that it turns the combustion engine off at the collection stops and uses electric power to load and compact waste. In this master's thesis the environmental performance of such a gas-electric hybrid waste collection vehicle was evaluated in comparison with a conventional diesel vehicle and a natural gas vehicle without the hybrid technique.''
Detailed Purpose	Excerpt from the report (for report see 'Publication'): ''The goal of this LCA study was to evaluate the environmental impact from a waste collection vehicle running on natural gas and loading waste by using electricity when used in the central parts of Gothenburg.(...) The purpose of the study was to use the results as a platform for decisions of future waste collection within Renova AB - if hybrid vehicles should be used and what is most important to improve for minimisation of the environmental impact. The intended audience of the report is mainly personnel at Renova but also some suppliers are interested in the results.''
Commissioner	Renova AB & Chalmers University of Technology - .

Practitioner	Anna Boss - .
Reviewer	Carl Jensen, Renova AB and Karin Andersson, Chalmers -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.
About Data	Excerpts from the report (for report see 'Publication'): ''Renova uses the electric hybrid vehicles to collect waste in central Gothenburg and transport it to their waste incineration plant in Sävenäs (in Gothenburg). Specific measurements of emissions and energy use from this area were used. Electricity used in the hybrid vehicle was assumed to originate from average Swedish electricity production. In the production of the vehicle, both specific and general average data were used; see further in sections 3.1 and 3.2.'' ''Many parts, which often are replaced, are available at Renova's storage and these were weighed and the material contents were assessed by visual inspection and estimation. Missing parts with the same function as available ones were assumed to be similar to the available ones. Other parts were assessed in a discussion with Bengt Svensson at the workshop. Starter batteries were estimated to weigh 20 kg and the same material data were used as for the batteries in the electric hybrid equipment. In the work orders, tires are not included, but according to Jan Örn at the workshop (personal communication) they are usually replaced once every year. A set of tires weighs 370 kg according to Robert Svensson at Volvo (personal communication). The total materials used in maintenance and repair corresponding to a vehicle life cycle, not including extra material for hybrid equipment, are shown in Table 17. For the production of these materials the same general data were used as in the production phase of the vehicle (see section 3.1.1). ''Other chemicals'' are mainly windscreenwasher fluid and antifreeze and they have not been traced back to the cradle. Table 17. Materials used in maintenance and repair. Material Weight [kg] Steel 1150 Aluminium 95 Copper 0.86 Plastics 163 Rubber (mainly tires) 3390 Glass 22.7 Paper 2.7 Lead batteries 106 Oil 1130 Other chemicals 535 litres The batteries in the electric hybrid can be charged about 1000 times (Österman, 2002), which is not enough for the entire life of the vehicle. In this study it was assumed that the batteries will be replaced twice during a lifetime of ten years. Calculations for the extra repair needed on hybrid vehicles are based on the production and waste of two extra sets of batteries. The waste generated during maintenance and repair was estimated from the materials consumed. The amounts of scrap was estimated by using the same degree of recycling of metals as in the end-of-life treatment of the vehicle at Stena fragmentering, 97% (compare section 3.5). The metal fractions not recycled were assumed to be landfilled. Oil and other chemicals were presented as hazardous waste. The same amounts as used of tires, plastics, paper and glass respectively, were presented as waste of those materials. No further analysis of the waste was carried out, except for batteries (both starter batteries and hybrid equipment batteries), which are transported to Boliden Bergsöe in Landskrona, Sweden, as in section 3.5.'' ''Most of the disassembled parts are transported to the fragmentation facility at Stena fragmentering AB in Halmstad, Sweden. The facility treats a wide variety of scraps, of which about one third is vehicle scrap (Stena fragmentering AB, 2005). Stena fragmentises and sorts the scrap into separate material fractions. Allocation of environmental impacts was based on weight of the unsorted scrap input to the facility. The amount of sorted scrap from a vehicle out from the fragmentation facility was calculated from the total amount of metals in the vehicle and multiplying this by the degree of recycling. The total amount of sorted scrap from the facility was 137 930 tons. The total amount of the residuals including metals that could not be sorted out was 52 928 tons (Stena fragmentering AB, 2005) and the metal fraction in the residuals was 8% (Eskilsson, 2002). This gave the degree of recycling for metals: 137 930 / (137 930 + 52 928·0.08) = 97%'' ''The transportation to Stena fragmentering was assumed to be accomplished by truck and the distance from Gothenburg to Halmstad is 145 km. The recycling processes of the fragmentised scrap metals were allocated to material production for a future product, i.e. not included in this study. The batteries are sent from Gothenburg to Boliden Bergsöe in Landskrona, Sweden for lead recycling. It was assumed to be transported by truck, 244 km. The lead scrap from the batteries is presented as a negative input and the other materials in the batteries are presented as waste, but the recycling process was not included since it was allocated to production of new lead. For the rest of the hybrid electric equipment, waste is given according to the materials it consists of, with a 97% degree of recycling for metals (assumed to be the same as for the vehicle scrapping at Stena fragmentering). The residual metals were assumed to go to landfill, chemicals are presented as hazardous waste, and the rest of the materials used are presented as waste of the same materials.

	The waste was not further analysed.'' ____ ESA Database Project. Years: 2009-2011. Administering organisation: Chalmers University of Technology, the department of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA), assisted by Johan Tivander (ESA). Technical System	
Name	Waste collection vehicle, driven by compressed natural gas. ESA-DBP
Functional Unit	one metric ton of collected waste
Functional Unit Explanation	Collecting and transporting one ton of waste in Gothenburg city.
Process Type	Cradle to grave
Site	Gothenburg, Sweden
Sector	Sector
Owner	Gothenburg, Sweden
Technical system description	Excerpt from the report (for report see link below): ''2.2.1 Options Three types of waste collection vehicles were compared: · A diesel waste collection vehicle · A gas waste collection vehicle · A gas-electric hybrid waste collection vehicle (..) The vehicles are back-loading waste collection vehicles, used mainly for collection of municipal waste. The gas and diesel vehicles use the combustion engines both when they run and when they load waste (...) The vehicles consist of a truck chassis from Volvo AB, model FL6E, and a waste collection unit, i.e. the container and waste loading equipment on the truck, from Norba AB, model RL 200L.'' ''When a waste collection vehicle stops to collect waste, the combustion engine is kept running and is used to lift the waste into the truck and to compact it. This also means that the vehicle idles for a considerable amount of time when the workers collect waste bins, emitting pollutants without doing any work. The collection is often also considered noisy by people in the vicinity. According to measurements at Renova, the time a waste collection vehicle stands still accounts for about 60 percent of the total working time when operating in the central parts of Gothenburg (Österman, 2002). In 2002, Renova, together with Volvo AB, Norba AB and ETP AB, started to develop a vehicle that uses natural gas when running, but automatically turns the combustion engine off when it has stopped and uses electricity to load and compact the waste. Using this technique reduces air emissions and noise in the vicinity of the collection sites.'' Figure 5 in the report shows a flow chart of the life cycle of the vehicles.

	Some facts about the diesel (and gas) vehicle (Table 1 in the report): Truck model: Volvo FL6E Waste collection unit model: Norba RL 200L Manufacturing year: 2001 Service Weight: 10 720 kg Loading capacity: 7 280 kg Engine power: 162 kW Emissions control: Catalytic converter and CRT particle filter This process is included in the system described in Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. System Boundaries

Nature Boundary	Excerpt from the report (for report see 'Publication'): ''The LCA covers all of the life cycle of the waste collection vehicles from the cradle, when raw materials are extracted, to the grave, end-of-life treatment of the used vehicle.''
Time Boundary	Excerpt from the report (for report see 'Publication'): ''The assessment focuses on the technical system of today with a few years' perspective; data from the recent years were used, and the lifetime of a vehicle was assumed to be ten years.'' NB: The report is written in 2004 and 2005.
Geographical Boundary	The study is limited to waste collection in central Gothenburg, Sweden.
Other Boundaries	Excerpts from the report (for report see 'Publication'): ''The LCA covers all of the life cycle of the waste collection vehicles from the cradle, when raw materials are extracted, to the grave, end-of-life treatment of the used vehicle. Maintenance and repair was also accounted for. Concerning the end-of-life treatment, sorting into different material fractions was included whereas re-melting to produce another product was allocated to the new product, thus not accounted for.'' NB: The waste treatment (e.g. burning) of the collected waste was not included in the life cycle of the waste collection vehicle. ''Environmental impacts from the manufacturing of capital goods, such as machines used in the manufacturing of the vehicles, were not considered, nor were impacts from activities of employees.'' ''The study is limited to waste collection in central Gothenburg, using a Volvo chassis of model FL6E with a Norba waste collection unit of model RL 200L. The gas vehicles were assumed to use natural gas (not biogas). Environmental impacts from noise or odour were not considered.''

Allocations	Excerpts from the report (for report see 'Publication'): ''Concerning the end-of-life treatment, sorting into different material fractions was included whereas re-melting to produce another product was allocated to the new product, thus not accounted for.'' ''Allocations in material production were mainly based on weight and in vehicle manufacturing processes, on number of products.'' ''Most of the disassembled parts are transported to the fragmentation facility at Stena fragmentering AB in Halmstad, Sweden. The facility treats a wide variety of scraps, of which about one third is vehicle scrap (Stena fragmentering AB, 2005). Stena fragmentises and sorts the scrap into separate material fractions. Allocation of environmental impacts was based on weight of the unsorted scrap input to the facility. The amount of sorted scrap from a vehicle out from the fragmentation facility was calculated from the total amount of metals in the vehicle and multiplying this by the degree of recycling. The total amount of sorted scrap from the facility was 137 930 tons. The total amount of the residuals including metals that could not be sorted out was 52 928 tons (Stena fragmentering AB, 2005) and the metal fraction in the residuals was 8% (Eskilsson, 2002). This gave the degree of recycling for metals: 137 930 / (137 930+52 928·0.08) = 97%''
Systems Expansions	Excerpt from the report (for report see 'Publication'): ''A few system expansions were used to account for excess energy produced in some processes.''

General Activity QMetaData

Date Conceived	2004
Data Type	Derived, mixed
Represents	See 'Function'.
Method	Excerpt from the report: ''2.3.2 Data collection From the use phase, data from direct measurements carried out at Renova of the studied vehicles were available. Also for the maintenance and repair, data from Renova were used. Data concerning production and end-of-life treatment were collected by personal communication, from annual environmental reports and from previous life cycle assessment reports. The main calculations were carried out in the LCA software LCAiT (CIT Ekologik, 2003), where some general data also were included.'' NB: Chapter 2.3.2 is a chapter in the report. The reference (CIT Ekologik, 2003) can be found in the report.
Literature Reference	Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. About Inventory

Publication	Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. Environmental Systems Analysis report 2005:7, Chalmers University of Technology, Gothenburg, Sweden http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--7.pdf
Intended User	Renova AB and LCA practitioners
General Purpose	Excerpt from the report (for report see 'Publication'): ''The waste and recycling company Renova AB has developed a new type of waste collection vehicle, which has been used and evaluated for waste collection in central Gothenburg for a few years. What distinguishes this type of vehicle from conventional waste collection vehicles is, firstly, that it uses natural gas to drive instead of diesel, and secondly, that it turns the combustion engine off at the collection stops and uses electric power to load and compact waste. In this master's thesis the environmental performance of such a gas-electric hybrid waste collection vehicle was evaluated in comparison with a conventional diesel vehicle and a natural gas vehicle without the hybrid technique.''
Detailed Purpose	Excerpt from the report (for report see 'Publication'): ''The goal of this LCA study was to evaluate the environmental impact from a waste collection vehicle running on natural gas and loading waste by using electricity when used in the central parts of Gothenburg.(...) The purpose of the study was to use the results as a platform for decisions of future waste collection within Renova AB - if hybrid vehicles should be used and what is most important to improve for minimisation of the environmental impact. The intended audience of the report is mainly personnel at Renova but also some suppliers are interested in the results.''
Commissioner	Renova AB & Chalmers University of Technology - .
Practitioner	Anna Boss - .
Reviewer	Carl Jensen, Renova AB and Karin Andersson, Chalmers -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.

About Data	Excerpts from the report (for report see 'Publication'): ''Renova uses the electric hybrid vehicles to collect waste in central Gothenburg and transport it to their waste incineration plant in Sävenäs (in Gothenburg). Specific measurements of emissions and energy use from this area were used. Electricity used in the hybrid vehicle was assumed to originate from average Swedish electricity production. In the production of the vehicle, both specific and general average data were used; see further in sections 3.1 and 3.2.'' ''Many parts, which often are replaced, are available at Renova's storage and these were weighed and the material contents were assessed by visual inspection and estimation. Missing parts with the same function as available ones were assumed to be similar to the available ones. Other parts were assessed in a discussion with Bengt Svensson at the workshop. Starter batteries were estimated to weigh 20 kg and the same material data were used as for the batteries in the electric hybrid equipment. In the work orders, tires are not included, but according to Jan Örn at the workshop (personal communication) they are usually replaced once every year. A set of tires weighs 370 kg according to Robert Svensson at Volvo (personal communication). The total materials used in maintenance and repair corresponding to a vehicle life cycle, not including extra material for hybrid equipment, are shown in Table 17. For the production of these materials the same general data were used as in the production phase of the vehicle (see section 3.1.1). ''Other chemicals'' are mainly windscreenwasher fluid and antifreeze and they have not been traced back to the cradle. Table 17. Materials used in maintenance and repair. Material Weight [kg] Steel 1150 Aluminium 95 Copper 0.86 Plastics 163 Rubber (mainly tires) 3390 Glass 22.7 Paper 2.7 Lead batteries 106 Oil 1130 Other chemicals 535 litres The batteries in the electric hybrid can be charged about 1000 times (Österman, 2002), which is not enough for the entire life of the vehicle. In this study it was assumed that the batteries will be replaced twice during a lifetime of ten years. Calculations for the extra repair needed on hybrid vehicles are based on the production and waste of two extra sets of batteries. The waste generated during maintenance and repair was estimated from the materials consumed. The amounts of scrap was estimated by using the same degree of recycling of metals as in the end-of-life treatment of the vehicle at Stena fragmentering, 97% (compare section 3.5). The metal fractions not recycled were assumed to be landfilled. Oil and other chemicals were presented as hazardous waste. The same amounts as used of tires, plastics, paper and glass respectively, were presented as waste of those materials. No further analysis of the waste was carried out, except for batteries (both starter batteries and hybrid equipment batteries), which are transported to Boliden Bergsöe in Landskrona, Sweden, as in section 3.5.'' ''Most of the disassembled parts are transported to the fragmentation facility at Stena fragmentering AB in Halmstad, Sweden. The facility treats a wide variety of scraps, of which about one third is vehicle scrap (Stena fragmentering AB, 2005). Stena fragmentises and sorts the scrap into separate material fractions. Allocation of environmental impacts was based on weight of the unsorted scrap input to the facility. The amount of sorted scrap from a vehicle out from the fragmentation facility was calculated from the total amount of metals in the vehicle and multiplying this by the degree of recycling. The total amount of sorted scrap from the facility was 137 930 tons. The total amount of the residuals including metals that could not be sorted out was 52 928 tons (Stena fragmentering AB, 2005) and the metal fraction in the residuals was 8% (Eskilsson, 2002). This gave the degree of recycling for metals: 137 930 / (137 930 + 52 928·0.08) = 97%'' ''The transportation to Stena fragmentering was assumed to be accomplished by truck and the distance from Gothenburg to Halmstad is 145 km. The recycling processes of the fragmentised scrap metals were allocated to material production for a future product, i.e. not included in this study. The batteries are sent from Gothenburg to Boliden Bergsöe in Landskrona, Sweden for lead recycling. It was assumed to be transported by truck, 244 km. The lead scrap from the batteries is presented as a negative input and the other materials in the batteries are presented as waste, but the recycling process was not included since it was allocated to production of new lead. For the rest of the hybrid electric equipment, waste is given according to the materials it consists of, with a 97% degree of recycling for metals (assumed to be the same as for the vehicle scrapping at Stena fragmentering). The residual metals were assumed to go to landfill, chemicals are presented as hazardous waste, and the rest of the materials used are presented as waste of the same materials. The waste was not further analysed.'' ____ ESA Database Project. Years: 2009-2011.

	Administering organisation: Chalmers University of Technology, the department of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA), assisted by Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	Excerpt from the report (for report see 'Publication'): ''The conventional gas vehicle and the hybrid vehicle use compressed natural gas as fuel. When the terms ''gas vehicle'' or ''gas engine'' are used in this report they refer to a vehicle running on natural gas (and should not be confused with petrol).

Technical System	
Name	Waste collection vehicle, driven by electricity and compressed natural gas. ESA-DBP
Functional Unit	one metric ton of collected waste
Functional Unit Explanation	Collecting and transporting one ton of waste in Gothenburg city.
Process Type	Cradle to grave
Site	Gothenburg, Sweden
Sector	Sector
Owner	Gothenburg, Sweden
Technical system description	Excerpt from the report (for report see link below): ''2.2.1 Options Three types of waste collection vehicles were compared: · A diesel waste collection vehicle · A gas waste collection vehicle · A gas-electric hybrid waste collection vehicle (..) the hybrid vehicle runs using the gas engine but turns the engine off and uses electric power from two lead batteries via an electric motor when loading. The combustion engine is turned off 30 seconds after the vehicle has stopped and the electric motor is used only when loading and compacting waste. Charging of the batteries is mainly done at night from the electric net, but it can also be done, if needed, with power from the combustion engine during operation. The vehicles consist of a truck chassis from Volvo AB, model FL6E, and a waste collection unit, i.e. the container and waste loading equipment on the truck, from Norba AB, model RL 200L.'' ''When a waste collection vehicle stops to collect waste, the combustion engine is kept running and is used to lift the waste into the truck and to compact it. This also means that the vehicle idles for a considerable amount of time when the workers collect waste bins, emitting pollutants without doing any work. The collection is often also considered noisy by people in the vicinity. According to measurements at Renova, the time a waste collection vehicle stands still accounts for about 60 percent of the total working time when operating in the central parts of Gothenburg (Österman, 2002). In 2002, Renova, together with Volvo AB, Norba AB and ETP AB, started to develop a vehicle that uses natural gas when running, but automatically turns the combustion engine off when it has stopped and uses electricity to load and compact the waste. Using this technique reduces air emissions and noise in the vicinity of the collection sites.'' Figure 5 in the report shows a flow chart of the life cycle of the vehicles.

	Some facts about the diesel (and gas) vehicle (Table 1 in the report): Truck model: Volvo FL6E Waste collection unit model: Norba RL 200L Manufacturing year: 2003 Service Weight: 12 170 kg Loading capacity: 5 830 kg Engine power: 150 kW Emissions control: Catalytic converter This process is included in the system described in Boss A, 2005, Life cycle assessment of a gas-electric hybrid waste collection vehicle - comparison with conventional waste collection vehicles. Environmental Systems Analysis report 2005:7, Chalmers University of Technology, Gothenburg, Sweden at http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--7.pdf Other processes in the CPM Database also included in the above publication: Truck chassi manufacturing. ESA-DBP Truck tire production. ESA-DBP Transportation with diesel driven waste collection vehicle. ESA-DBP Transportation with gas driven waste collection vehicle. ESA-DBP Transportation with hybrid (gas-electric driven) waste collection vehicle. ESA-DBP Collection area driving, with diesel driven waste collection vehicle. ESA-DBP Collection area driving, with gas driven waste collection vehicle. ESA-DBP Collection area driving, with hybrid (gas-electric driven) waste collection vehicle. ESA-DBP Collection stop, with hybrid (gas-electric driven) waste collection vehicle. ESA-DBP Waste collection vehicle, diesel driven. ESA-DBP Waste collection vehicle, driven by compressed natural gas. ESA-DBP

System Boundaries

Nature Boundary	Excerpt from the report (for report see 'Publication'): ''The LCA covers all of the life cycle of the waste collection vehicles from the cradle, when raw materials are extracted, to the grave, end-of-life treatment of the used vehicle.''
Time Boundary	Excerpt from the report (for report see 'Publication'): ''The assessment focuses on the technical system of today with a few years' perspective; data from the recent years were used, and the lifetime of a vehicle was assumed to be ten years.'' NB: The report is written in 2004 and 2005.
Geographical Boundary	The study is limited to waste collection in central Gothenburg, Sweden.
Other Boundaries	Excerpts from the report (for report see 'Publication'): ''The LCA covers all of the life cycle of the waste collection vehicles from the cradle, when raw materials are extracted, to the grave, end-of-life treatment of the used vehicle. Maintenance and repair was also accounted for. Concerning the end-of-life treatment, sorting into different material fractions was included whereas re-melting to produce another product was allocated to the new product, thus not accounted for.'' NB: The waste treatment (e.g. burning) of the collected waste was not included in the life cycle of the waste collection vehicle. ''Environmental impacts from the manufacturing of capital goods, such as machines used in the manufacturing of the vehicles, were not considered, nor were impacts from activities of employees.'' ''The study is limited to waste collection in central Gothenburg, using a Volvo chassis of model FL6E with a Norba waste collection unit of model RL 200L. The gas vehicles were assumed to use natural gas (not biogas). Environmental impacts from noise or odour were not considered.''
Allocations	Excerpts from the report (for report see 'Publication'): ''Concerning the end-of-life treatment, sorting into different material fractions was included whereas re-melting to produce another product was allocated to the new product, thus not accounted for.'' ''Allocations in material production were mainly based on weight and in vehicle manufacturing processes, on number of products.'' ''Most of the disassembled parts are transported to the fragmentation facility at Stena fragmentering AB in Halmstad, Sweden. The facility treats a wide variety of scraps, of which about one third is vehicle scrap (Stena fragmentering AB, 2005). Stena fragmentises and sorts the scrap into separate material fractions. Allocation of environmental impacts was based on weight of the unsorted scrap input to the facility. The amount of sorted scrap from a vehicle out from the fragmentation facility was calculated from the total amount of metals in the vehicle and multiplying this by the degree of recycling. The total amount of sorted scrap from the facility was 137 930 tons. The total amount of the residuals including metals that could not be sorted out was 52 928 tons (Stena fragmentering AB, 2005) and the metal fraction in the residuals was 8% (Eskilsson, 2002). This gave the degree of recycling for metals: 137 930 / (137 930+52 928·0.08) = 97%''

Systems Expansions	Excerpt from the report (for report see 'Publication'): "A few system expansions were used to account for excess energy produced in some processes."

Practitioner	Anna Boss - .
Reviewer	Carl Jensen, Renova AB and Karin Andersson, Chalmers -
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.
About Data	Excerpts from the report (for report see 'Publication'): ''Renova uses the electric hybrid vehicles to collect waste in central Gothenburg and transport it to their waste incineration plant in Sävenäs (in Gothenburg). Specific measurements of emissions and energy use from this area were used. Electricity used in the hybrid vehicle was assumed to originate from average Swedish electricity production. In the production of the vehicle, both specific and general average data were used; see further in sections 3.1 and 3.2.'' ''Many parts, which often are replaced, are available at Renova's storage and these were weighed and the material contents were assessed by visual inspection and estimation. Missing parts with the same function as available ones were assumed to be similar to

	the available ones. Other parts were assessed in a discussion with Bengt Svensson at the workshop. Starter batteries were estimated to weigh 20 kg and the same material data were used as for the batteries in the electric hybrid equipment. In the work orders, tires are not included, but according to Jan Örn at the workshop (personal communication) they are usually replaced once every year. A set of tires weighs 370 kg according to Robert Svensson at Volvo (personal communication). The total materials used in maintenance and repair corresponding to a vehicle life cycle, not including extra material for hybrid equipment, are shown in Table 17. For the production of these materials the same general data were used as in the production phase of the vehicle (see section 3.1.1). ''Other chemicals'' are mainly windscreenwasher fluid and antifreeze and they have not been traced back to the cradle. Table 17. Materials used in maintenance and repair. Material Weight [kg] Steel 1150 Aluminium 95 Copper 0.86 Plastics 163 Rubber (mainly tires) 3390 Glass 22.7 Paper 2.7 Lead batteries 106 Oil 1130 Other chemicals 535 litres The batteries in the electric hybrid can be charged about 1000 times (Österman, 2002), which is not enough for the entire life of the vehicle. In this study it was assumed that the batteries will be replaced twice during a lifetime of ten years. Calculations for the extra repair needed on hybrid vehicles are based on the production and waste of two extra sets of batteries. The waste generated during maintenance and repair was estimated from the materials consumed. The amounts of scrap was estimated by using the same degree of recycling of metals as in the end-of-life treatment of the vehicle at Stena fragmentering, 97% (compare section 3.5). The metal fractions not recycled were assumed to be landfilled. Oil and other chemicals were presented as hazardous waste. The same amounts as used of tires, plastics, paper and glass respectively, were presented as waste of those materials. No further analysis of the waste was carried out, except for batteries (both starter batteries and hybrid equipment batteries), which are transported to Boliden Bergsöe in Landskrona, Sweden, as in section 3.5.'' ''Most of the disassembled parts are transported to the fragmentation facility at Stena fragmentering AB in Halmstad, Sweden. The facility treats a wide variety of scraps, of which about one third is vehicle scrap (Stena fragmentering AB, 2005). Stena fragmentises and sorts the scrap into separate material fractions. Allocation of environmental impacts was based on weight of the unsorted scrap input to the facility. The amount of sorted scrap from a vehicle out from the fragmentation facility was calculated from the total amount of metals in the vehicle and multiplying this by the degree of recycling. The total amount of sorted scrap from the facility was 137 930 tons. The total amount of the residuals including metals that could not be sorted out was 52 928 tons (Stena fragmentering AB, 2005) and the metal fraction in the residuals was 8% (Eskilsson, 2002). This gave the degree of recycling for metals: 137 930 / (137 930 + 52 928·0.08) = 97%'' ''The transportation to Stena fragmentering was assumed to be accomplished by truck and the distance from Gothenburg to Halmstad is 145 km. The recycling processes of the fragmentised scrap metals were allocated to material production for a future product, i.e. not included in this study. The batteries are sent from Gothenburg to Boliden Bergsöe in Landskrona, Sweden for lead recycling. It was assumed to be transported by truck, 244 km. The lead scrap from the batteries is presented as a negative input and the other materials in the batteries are presented as waste, but the recycling process was not included since it was allocated to production of new lead. For the rest of the hybrid electric equipment, waste is given according to the materials it consists of, with a 97% degree of recycling for metals (assumed to be the same as for the vehicle scrapping at Stena fragmentering). The residual metals were assumed to go to landfill, chemicals are presented as hazardous waste, and the rest of the materials used are presented as waste of the same materials. The waste was not further analysed.'' ____ ESA Database Project. Years: 2009-2011. Administering organisation: Chalmers University of Technology, the department of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA), assisted by Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	Excerpt from the report (for report see 'Publication'): ''The conventional gas vehicle and the hybrid vehicle use compressed natural gas as fuel. When the terms ''gas vehicle'' or ''gas engine'' are used in this report they refer to a vehicle running on natural gas (and should not be confused with petrol).

Technical System	
Name	Waste disposal
Functional Unit	1996
Functional Unit Explanation	The data in the table represents the total waste that has been disposed during the time 1996-03-02 - 1997-03-01. The waste admitted by Tyft: Solid waste (compressed) 55m3 Dewatered sludge 1540 m3 Latrine 20 m3 Combustible waste 4177 ton Sorted out and, in some cases, recycled: Paper (recycled) 495 ton Glass (recycled) 234 ton Batteries (recycled) 2 ton Scrap 386 ton Refrigerators 818 pcs Fabrics 33 ton Fluorescent lamps 4802 pcs Electronical scrap 13, 754 ton Carboard (recycled) 118 ton Corrugated cardboard 155 ton Metal packages (recycled) 4 ton Plastic packages (recycled) 3 ton Tyres 46000 pcs Splinter 2500 m3 Hazardous waste 10,300 ton Waste oil 27 m3
Process Type	Gate to gate
Site	The municipality of Tanum Pl 2538 457 91 Tanumshede Sweden
Sector	Waste management
Owner	The municipality of Tanum Pl 2538 457 91 Tanumshede Sweden
Technical system description	Tyft waste disposal plant, sorts, dumpes and stores waste. A detalied description of the plant follows below. The municipality has 9700 houses, where 4725 has its own compost (registrated at the end of 1996). The plant is situated about 7,5 km ouside Tanumshede population centre. The total area is 240 ha and the dump area 7 ha. The area is drained to Gramsälven, that changes name further down to Anråsälven and flows into Fjällbackafjorden, north of Fjällbacka. The nearest house is at a distance of 500 m and there are five houses within a radius of one km. The waste consists of household waste, waste from offices and shops, building waste, industrial waste, latrine, sludge and some business related waste as plush and panel from Volvo, plastics from Inventing and film reels from Extra Film. Business related waste that can be recycled or is harzadous is sorted out. The rest is,

	together with the household waste, transported to a combustion plant in Göteborg. Non-combustible waste, as plaster and insulating material is dumped in the area. The sludge is dewatered at the purification plant in Tanum. The dewatered sludge is composted at a special site in the area. Composted material is used as landfilling, though no sludge has been used in parks or agricultures. The white goods that contain CFC:s is temporarily stored at Tyft, and about 2-3 times a year transported to the recycling plant in Halmstad. The white goods and electronics is collected at the houses. The waste oil is collected in a special oil tank and temporarily stored, together with chemicals and other hazardous waste. Scrap and splinter are dumped.

System Boundaries

Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires. Non combustable waste like plaster, insulating material etc is dumped within the area. The amount is not specified in the environmental report.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries	Eventually the hazardous waste is collected by Traab.

Date Conceived	1996
Data Type	Unspecified
Represents	See 'Function'.
Method	Study the Environmental Report from Tyft in the municipality of Tanum for 1996, The Board of County in Göteborg and Bohus. The amounts in the table are taken directly from the environmental report, and shows the resourses, residues and emissions for the annual production of 1996. The emissions to water, Gramseälven, are analysed by AnalyCen Nordic AB (Box 11404, 404 29 Göteborg, Sweden, Phone +46 -31 613740, Fax +46 -31 150512). The total amount of water led to Gramseälven during 1996 was 22500 m3.

Technical System	
Name	Waste disposal of building, industrial and hazardous waste
Functional Unit	ton

Functional Unit Explanation	1ton dewatered industrial waste consisting of: Industrial waste 5,4% Industrial sludge 7,5% Paint waste 7,9% Spolgropsavfall 17,0% Mechanical wood-pulp 32,0% Metal hydroxide sludge 23,2% Contaminated soil 7,0%
Process Type	Gate to gate
Site	Reci Industri AB The refuse dump of Torsviken Pl 8743 417 91 Göteborg Sweden
Sector	Waste management
Owner	Reci Industri AB The refuse dump of Torsviken Pl 8743 417 91 Göteborg Sweden
Technical system description	Reci Industri AB recives solid industrial waste, contaminated soil, industrial sludge, solid/half solid paint waste, mechanical wood-pulp, waste water from car washes etc. and metal hydroxide slam. Waste transported to Torslanda is dumped in different reservoirs depending on its contents. Leachate from the area is pumped into the internal sewage treatment works, where it is treated with calcium oxide. The area is situated in a depression. Torsviken is a bay, but the dumping area is as a whole placed on solid ground. The total area amounts to 16 ha, and is bounded to the north by a road, to the east by a mountain ridge, to the south by Göteborgs Hamn's dredge dump and to the west by Torslanda airfield. The surface layer at the dump consists of fine sediment and clay. The upper layer contains organic material and mud and has a thickness of about 1 m in the center of the area. Below the mud there is clay, which at the south of the depression amounts to a thickness of 25 m. The surface water in the area is naturally drained by a brook that passes through the dumping area. The dump is surrounded with banks built of noncombustible material. The banks are packed with 0,5 m thick layer of clay on the inside. The layer of clay connects to the natural layer in the ground so that no leachate will not leak out from the area.

System Boundaries

Nature Boundary	The company is not obligated to state other emission- or waste substances than the Swedish Environmental Protection law requires. The surrounding nature can be seen as a part of the system because it works as a waste dump for all the substances. The ground also in some cases serves as a filter, which purifies the water. The cleansed leach water, from the sewage treatment works, is led to Göteborgs Hamn's dredge dump. Measurements concerning air emission have been done but are not documented in the report. Though they are reported to be below the legislated limit for urban areas. Measurements concerning noise have been done but are not documented in the report. Though they are reported to be below the legislated limit for external industry noise established by Swedish Environmental Protection Agency. There are no dwelling-houses in the surrounding area. The noise arises while transporting and loading the waste.
Time Boundary	The company is obligated to write an Environmental report once every year. Though the legislated limits can be changed only if the activity is changed.
Geographical Boundary	Sweden
Other Boundaries	The water treated in the internal sewage treatment works is led to Göteborgs Hamn's sludge dumping area.

Detailed Purpose	To control that the legislated limits are not exceeded.
Commissioner	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg. .
Practitioner	Hell, Mati - Reci Industri AB The refuse dump of Torsviken Pl 8743 417 91 Göteborg Sweden.
Reviewer	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg.

Applicability	The substances that are dumped in the area and not let out with the leachate, are not specified. The data is only useful in the cases where the waste in question has about the same composition as in this case.
About Data	The total amount of water passing the measure point during the year is 25 545 m3. The average water conductivity is 277 mS/m, the samples are analysed according to SIS 028123 with a margin of error of 10%. The average water temperature is 8,0°C. The average pH is 11,3, the samples are analysed according to ss 028122-2 with a margin of error of 5%. The measuring instrument is calibrated and inspected once a month.

Technical System	
Name	Waste to energy plant
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in a waste to energy plant located in Sweden. Municipal and industrial waste incinerated in the plant is converted into steam. Some of the steam is delivered to an industry, some is converted into heat and delivered to a district heating network. The plant fulfils two purposes; by getting rid of the waste and by recovering energy from the incineration. The waste to energy plant is used as base load for this district heating network system. TECHNICAL DATA FOR THE STUDIED PLANT: Avarage annual time of use (hours): - Total thermal output (MW): 33+22+5+5 Annual total fuel use (ton): 231 000 Annual total fuel use (MWh): ca 740 000 Normal annual production of heat (MWh): 594 000 Degree of thermal effieciecny (%): 80 PROCESS DESCRIPTION: The plant consists of four incineration units, two larger and two smaller ones, with a total thermal effect of 65 MW. Each unit has a furnace equiped with a stoker for incineration and a steam boiler. The dust is removed from the flue gas in an electrostatic precipitator, where about 99 % of the dust (fly ash) is removed. The flue gas from all four units are then led to a waste heat boiler which decreases the flue gas temperature and recovers about 9 MW heat. In order to clean flue gas from dust, hydrochloric acid, hydrofluoric acid, mercury and other heavy metals, the flue gas is then led to a wet scrubber/condensation flue gas cleaning

	system. This system operates at acidic conditions and is therefore adjusted to firstly remove hydrochloric acid and mercury. Sulphur dioxide is not removed in this step, but can be removed from a similar system operating at neutral conditions. In the same unit about 20 MW heat from the condensation process is produced. The heat is absorbed using absorption heat pump systems. Water from the condensor is cleaned in a conventional waste water treatment system before it is discharged to a river. Herefore some chemicals are used. Limestone and hydrated lime is used to neutralize the condensate. A flocculation agent, a polymer, is added to bind the percipitated pollutants into large clusters. A precipitation agent is added to bind the heavy metals. After the scrubber/condenser the gas is reheated and passed to a final dry flue gas cleaning system consisting of a reactor and a fabric filter, in order to remove sulphur dioxide and dioxine. Hydrated lime and fly ash, removed from the electrostatic precipitator, and in some occations activated carbon, are injected. The cleaned flue gas is then reheated and led through the smokestack to the air. INCLUDED OPERATIONS: The process study consists of the following operations: -The pretreatment of the waste before incineration. -The feeding of the waste into the incineration process. -The incineration process. -The flue gas cleaning process, both wet and dry flue gas cleaning, including the separation of dust, HCl, SOx, heavy metals and dioxine. -The treatment of the condensate from the wet flue gas cleaning process, including the separation of heavy metals and dioxine. -The treatment of the residues from the incineration and cleaning process. -The internal consumption of electricity. -The internal consumption of chemicals used in the flue gas cleaning system, with the exemption of chemicals for feed water treatment. NOx CONTROL: - The boilers are equiped with SNCR systems with urea as the reducing agent. Two of the boilers are equiped with flue gas recirculation. - SNCR (Selective Noncatalytic Reduction) describes a method for reducing the NOx already formed during the combustion process. In the process, an aqueous reduction agent mixed in water or steam is injected into the furnace during the combustion process. The reduction agent reduces the NOx and forms nitrogen and water. - Flue gas recirculation describes a method for limiting the NOx-formation during the combustion process. The process involves temperature and air supply optimization OTHER FLUE GAS CLEANING SYSTEMS: For the removal of dust from the flue gas an electrostatic precipitator is used. In an electrostatic precipitator the dust particles are electrified and then separated from the flue gas stream by passing through an electric field with largest possible intensity. In order to clean flue gas from dust, hydrochloric acid, hydrofluoric acid, mercury and other heavy metals, the flue gas is also led to a wet scrubber/condensation flue gas cleaning system.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are normally measured and reported once yearly in a public environmental report. Waste to Energy Plants, unlike most heating plants with other fuels, are obliged to measure and report certain emissions such as heavy metals, clorides and dioxine. Other emissions, like COD, that are not measured, are therefore not reported here.
Time Boundary	APPLICABLE TIME OF SYSTEM: This inventory was conducted using data mainly from 1995. The data consists of average data on a year basis. This data is assumed to be valid until the enforcement of the new European Community regulations for Waste to Energy Plants in the EC countries, or until new national or local regulations are enforced in Sweden.
Geographical Boundary	GEOGRAPHICAL EXTENSION (for large technical systems): This inventory has been conducted on a Waste to Energy Plant in Sweden, with swedish regulations, applicable during 1995. The collected data should only be used for swedish conditions.
Other Boundaries	NOTES OF EXCLUDED TECHNICAL SYSTEMS: The following operations have been excluded from the system: - The distribution of district heat and process steam (and electricity) from the plant to the consumers. - Building of the plant and the district heating net. - The cradle to gate of the chemicals used in the plant. - The cradle to gate of the internal electricity consumption. - The chemicals used for feed water treatment. - The water consumption in the processes. - The formation of the waste in households, industries etc. - The transportation of the waste from the ''waste producers'' to the Waste to Energy Plant. - The transportation of the residues from the incineration and cleaning process to the landfill. - The process at the landfill such as leaching, decomposition etc. The reduction system of nitrogen oxides has not been included in the system Waste to Energy Plant. The reduction system of nitrogen oxides has been treated as separate unit

	operations.
Allocations	PRINCIPLE APPLIED: In a heating plant one product of economic value is produced, heat. For operation and maintenance of the plant the use of resources and emissions are associated to the net production of heat.
Systems Expansions	N/A (unless aggregated system from special type of comparative LCI study)

Flow Data

General Activity QMetaData

Date Conceived	1995-01-01
Data Type	
Represents	See 'Function'.
Method	All data reported here is related to the functional unit 1 kWh heat produced in the heating plant. The data is originally given as the total yearly amount of an input (waste, chemicals, electricity etc.) to or an output (emissions to air and water, residues etc.) from the Waste to energy Plant. The inputs and outputs are then related to the functional unit by dividing the total yearly amount with the yearly amount of produced heat. For some flows specific information is given, see each flow.
Literature Reference	Data is in general recieved from ''Miljörapport 1995, Uppsala Energi AB, Fyriskraft AB, 1996-03-28'' and ''Sorterat avfall = Energi, Miljöanpassad energiåtervinning - praktikfall Uppsala, Kia Soisalo, Uppsala, 1996''.
Notes	The parameters presented are chosen because they are available in the annual environmental report of the plant. Data can be missing if it is not reported in the report. The type of data reported in the environmental report is governed by the inspection authority. All values are reported with 3 figures. The data are however seldom that accurate.

Flow Table and Specific Meta Data

QMetaData	***Direction***	***FlowType***	***Substance***	***Quantity***	***Min***	***Max***	***Unit***	***Environment***	***Geography***
Data type: Monitored data, continuous	Input	Refined resource	Electricity	0.041			kWh	Technosphere	
Data type: Monitored data, discrete Method: The measuring method used is unknown. Notes: The flocculation agent used is a polymere. The amount is given as a 50 percent solution.	Input	Refined resource	Flocculation agent	0.000307			g	Technosphere	
Data type: Monitored data, discrete Method: The measuring method used is unknown. Notes: The amount of hydrated lime reported, includes both the amount used in the water treatment process for the cleaning of the condensate, and the amount used in the dry flue gas cleaning system.	Input	Refined resource	Hydrated lime	1.19			g	Technosphere	
Data type: Monitored data, discrete Method: The measuring method used is unknown.	Input	Refined resource	Limestone	1.75			g	Technosphere	
Data type: Monitored data, discrete Method: The measuring method used is unknown. Notes: The precipitation agent used is an organic sulphide (TMT). The amount is given as a 15 percent solution.	Input	Refined resource	Precipitation agent	0.0209			g	Technosphere	
Data type: Monitored data, continuous Method: Every transport of waste is weighed at the plant and reported in the Environmental Report.	Input	Refined resource	Waste	388			g	Technosphere	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Cd	0.000000656			g	Water	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Co	0.00000104			g	Water	

Data type: Monitored data, continuous Method: This emission is measured continuously. The value for CO is originally given in mg/Nm3 in the flue gas. The value has then been calculated by multiplying the value in mg/Nm3, with the amount of flue gas given per ton waste incinerated (Here 5400 Nm3/ton waste is used for this plant). Literature: Data is picked from ''Svensk avfallsförbränning 1994-1995, Miljö och ekonomi. RVF Rapport 97:1, 1997''.	Output	Emission	CO	0.107			g	Air	
Data type: Monitored data, continuous Method: This emission is measured continuously. Notes: This value is the fossile amount (netto) of CO2, based on the assumption that household wastes mostly contains materials of biological origin. About 20 % have fossile origin. The total amount of CO2 (brutto) is about 1,13315 kg/ton waste.	Output	Emission	CO2	404			g	Air	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Cr	0.00000000138			g	Water	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Cu	0.0000129			g	Water	
Data type: Single sample Method: This emission is measured once yearly at the periodical inspection. The yearly amount of the emission is then estimated from this single sample.	Output	Emission	Dioxine	0.000000034			g	Air	
Data type: Single sample Represents: Value measured in 1996. Literature: Data is recieved from the report ''Avfallsförbränningen, Periodisk besiktning 1996, METLAB miljö AB, Laboratorium för Miljö- och Energiteknik, 1996''. Notes: The reported value is below the detection value of the measuring device.	Output	Emission	Dioxine	0.000171			g	Water	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Dust	0.00680			g	Air	
	Output	Emission	HC	0.0118			g	Air	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Hg	0.000000133			g	Water	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	NH3	0.00477			g	Water	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Ni	0.00000145			g	Water	
Data type: Monitored data, continuous Method: This emission is measured continously.	Output	Emission	NOx	0.243			g	Air	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Pb	0.00000216			g	Water	
Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	SO2	0.278			g	Air	

Data type: Monitored data, continuous Method: This emission is measured continuously.	Output	Emission	Zn	0.0000122			g	Water	
Data type: Monitored data, continuous Notes: Reported in the Environmental Report as steam delivered to the industry, and heat delivered to the district heating net .	Output	Product	Heat	1			kWh	Technosphere	
Data type: Monitored data, continuous	Output	Residue	Bottom ash	73.5			g	Technosphere	
	Output	Residue	Fly ash	8.37			g	Technosphere	

About Inventory	
Publication	LCA värme, Vattenfalls Livscykelanalyser, Produktion av värme; Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius; SwedPower AB, Miljö & Kvalitet; 1999-07-01. -- Data documented by: Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders at SwedPower AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	Intended user of the data are
General Purpose	The general purpose of the inventory was to obtain a lifecycle inventory of heat producing plants using different types of fuels. A further purpose was to obtain data from heat producing plant with different capacities.
Detailed Purpose	The specific purpose is to compare data from plants producing heat, with various fuels, combustion technologies and flue gas cleaning systems.
Commissioner	Bodlund, Birgit - Vattenfall AB.
Practitioner	- SwedPower AB, Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders .
Reviewer	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
Applicability	CERTAIN CAUTIONS: In 1997, there were 21 Waste to Energy Plants in Sweden. Data from these plants have been collected and analysed, regarding environmental parameters. From the study the conclusion can be drawn, that emission of environmental pollutants depends solely on the national regulations regarding waste to energy plants. Therefore the variation of emissions from these plants are small. The European Community is now working out new regulations that are to be valid for waste to energy plants in all countries of the EC. These regulations will probably be much stricter than today in Sweden. Therefore data from a plant was selected, that already today fulfils the expected new regulations. The collected data should therefore only be used for swedish conditions. The expected EC-regulations will probably result in waste to energy plants equipped with both wet and dry flue gas cleaning systems. Today only two waste to energy plants are equipped with wet and dry flue gas cleaning systems, the others have either a wet or a dry cleaning system. EMISSIONS FROM WASTE INCINERATION: Household waste and other waste contain pollutants such as cloride, sulphur and heavy metals (cadmium, mercurium etc), as a result of what is throwed away in the society. The containment of pollutants varies every day, from one place to another and depends on what kind of waste that is treated. For example, mercury could be found in some fluorescent lamps, and cadmium could be found in cadmium batteries. By incineration of the waste these pollutants comes into the flue gas or in the ash. The pollutants have to be removed from the flue gas by flue gas cleaning.
About Data	
Notes	

SPINE LCI dataset: Waste treatment - incineration for heat in cement kiln (SWEA CKN)

Administrative	
Finished	Y
Date Completed	2013-03-18

Availability	Public

Technical System	
Name	Waste treatment - incineration for heat in cement kiln (SWEA CKN)
Functional Unit	1 kg waste fraction to incineration in cement kiln
Functional Unit Explanation	Data for the several separate waste fractions are available (see Technical system description).
Process Type	Gate to grave
Site	Sweden
Sector	Waste treatment
Owner	Sweden
Technical system description	This dataset represents Swedish BAT conditions in the period 2007-2010 for incineration of waste in cement kilns (CKN). It is a generic model applied to several waste fractions. The emissions from incineration are modeled for the incineration of the waste mix and further allocated to the specific waste fractions. Using data for incineration of only one specific fraction would not reflect the real situation, since the emission data for each fraction is valid in case of co-combustion with other fractions. Primary waste fractions: Chemical sludges and biosludges from industry 50%/50% (IndSludge Org), Paper and cardboard containers 14%, corrugated cardboard 30%, newsprint, journals and catalogues 42%, office paper 14% (Paper), Polyethylene, soft packaging (PE), PE 40%, PP 15%, PET 4%, PS 4%, PVC 11%, PUR 13%, PC 13% (Plastics), Rubber (Rubber), Wood excl. Transport pallets, excl. By-products e.g. reject from sawmill and tree felling, excl. Secondary wood waste from public recycling stations ÅVC (Wood) This model covers activities at the CKN plant. Waste collection (sorting and transporting) of incoming waste goods to the plant is not included. Heat energy generated is used for cement production and hence considered as avoided fuel and electricity production. The amount of ash and sludge generated is stated but treatment of this secondary waste in e.g. landfills is not included. For the secondary treatment of ash and sludge see the corresponding type of treatment e.g. landfill. That is, process models need to be linked in series. Internal technical system considered: The data reflect Swedish CKN plants' average operations. The kiln is assumed to be operating with a mix of all the waste fractions. Emissions and energy output are however provided for each specific waste fraction separately. Internal material consumption to operate the plant (e.g. machinery maintenance, etc.) is not included. The additives/chemicals consumption (e.g. lime, limestone, etc) necessary for incineration (emissions reduction) is included. Construction of capital goods e.g. buildings and machinery at the waste treatment facility is not included. Auxiliary facilities and operations such as offices and work travel are not included.

System Boundaries	
Nature Boundary	
Time Boundary	The modelled data is an approximation of BAT in Sweden in the period 2007-2010
Geographical Boundary	The model reflects the waste treatment system in Sweden.
Other Boundaries	See Technical system description
Allocations	As a base case, allocation is done on a material flow (mass) basis. That is, emissions are calculated in relation to the amount of a substance in each waste fraction. This is done for substances that are not transformed, where there is a mass balance. Other emissions are

	calculated in other ways depending on what was deemed the most relevant (allocated per MJ, or per total mass of the waste fraction). For landfill and incineration this is documented in Anna Björklund's licentiate thesis (Björklund A, 1998).

About Data	This dataset is part of the Swedish Waste Management Environmental Assessment (SWEA) LCA model of the Swedish waste treatment system (Björklund et al. 2009; Arushanyan et al. 2013). The SWEA model covers several waste fractions and several waste treatments. It was developed in the Towards Sustainable Waste Management - TOSUWAMA (Hållbar Avfallshantering) research programme, funded by Swedish EPA (Naturvårdsverket) running 2006-2013 (Ekvall et al. 2006). The main contributors to the SWEA model: Ola Eriksson - Gävle University (HiG);

	Anna Björklund, Christine Ambell, Yevgeniya Arushanyan - Environmental Strategies Research, Royal Institute of Technology (FMS KTH); Jan-Olof Sundqvist, Åsa Stenmark, Maria Ljunggren Söderman - Swedish Environmental Institute (IVL) This dataset is part of several datasets from the SWEA model published in CPM LCA Database. The datasets are: Waste treatment - SWEA model - incineration in combined heat and power plant (CHP) Waste treatment - SWEA model - incineration in heat only boiler plant (HOB) Waste treatment - SWEA model - incineration for heat in cement kiln (CKN) Waste treatment - SWEA model - reactor composting (CPR) Waste treatment - SWEA model - windrow composting (CPW) Waste treatment - SWEA model - landfill (LFL) More information about the TOSUWAMA project is available at www.hallbaravfallshantering.se. This dataset was documented in the CPM LCA Database by Johan Tivander, Environmental Systems Analysis, Chalmers University of Technology, Sweden. Review by Johan Tivander considers CPM LCA Database documentation criteria.

Technical System	
Name	Waste treatment - incineration in combined heat and power plant (SWEA CHP)
Functional Unit	1 kg waste fraction to incineration in CHP plant
Functional Unit Explanation	Data for the several separate waste fractions are available (see Technical system description).
Process Type	Gate to grave
Site	Sweden
Sector	Waste treatment
Owner	Sweden
Technical system description	This dataset represents Swedish BAT conditions in the period 2007-2010 for incineration of waste in combined heat and power plants (CHP) with incineration pan, heat and electric energy generator. It is a generic model applied to several waste fractions. The emissions from incineration are modeled for the incineration of the waste mix and further allocated to the specific waste fractions. Using data for incineration of only one specific fraction would not reflect the real situation, since the emission data for each fraction is valid in case of co-combustion with other fractions. Primary waste fractions (names in parenthesis correspond to names in the SWEA model): Animal waste from food industry (Animal), Paper and cardboard containers, (Cardboard) Corrugated cardboard (Corrugated cardboard), Discarded equipment including mainly metals and small amounts of plastic and rubber. Modeled as "metal mixed" (Equipment), Pulp (FibreReject), Food waste (Food), Glass container clear (Glass Clear), Glass container coloured (Glass Color), Gypsum (Gypsum), Hazardous waste from households waste bags (Hazardous), Other industrial effluent sludges inorganic (IndSludgeNOrg),

	Chemical sludges and biosludges from industry 50%/50% (IndSludgeOrg), Concrete, stone, bricks, not recycable (Inert mix), Metal waste, excluding the metal scrap from manufacturing, excluding return cans. The mix is: Aluminium 5%, ferrous metals (steel) 90%, stainless steel 2%, other metals modeled as copper 3% (Metal, mixed), Mixed municipal solid waste, the fractions and their shares are given in the corresponding data set (mixed MSW), Newsprint, journals, and catalogues (Newsprint), Sanitary products (diapers) and other combustible wood waste 24%/74% (OtherComb), Paper and cardboard containers 14%, corrugated cardboard 30%, newsprint, journals and catalogues 42%, office paper 14% (Paper, mixed), Park and yard waste with high heating value (Park, high HHV), Park and yard waste with low heating value (Park_h, low HHV), Polyethylene, soft packaging (PE), PE 40%, PP 15%, PET 4%, PS 4%, PVC 11%, PUR 13%, PC 13% (Plastics, mixed), Polystyrene (PS), Fibre recycling reject (RecFibRej), Rubber (Rubber), Public sewage sludge - digested (Sewage Sludge), Textile production waste (Textile), Vegetal waste from food processing (Vegetal), Wood excl. Transport pallets, excl. By-products e.g.reject from sawmill and tree felling, excl. Secondary wood waste from public recycling stations ÅVC (Wood) Secondary waste fractions: Reject from anaerobic digestion (CHP (reject from ADG) - (Animal, Foodsl, IndSludgeOrg, Manure, Vegetal) Reject from reactor composting (CHP (reject from CPR) - Animal, Foods, Park_h, Vegetal) Reject from windrow composting (CHP (reject from CPW) - Industrial sludge org, Manure, Park, SewSludge) This model covers activities at the CHP plant. Waste collection (sorting and transporting) of incoming waste goods to the plant is not included. Output heat and electricity energy is considered as delivered onto Swedish heating and electricity grid. Energy losses after point of delivery on the grid are not included. The amount of ash and sludge generated is stated but treatment of this secondary waste in e.g. landfills is not included. For the secondary treatment of ash and sludge see the corresponding type of treatment e.g. landfill. That is, process models need to be linked in series. Internal technical system considered: The data reflect Swedish CHP plants' average operations. The incineration furnace is assumed to be operating with a mix of all the waste fractions. Emissions and energy output are however allocated for each specific waste fraction separately. Internal energy consumption at the plant is included and is stated as "electricity input". Internal material consumption at the plant (e.g. greasing, fuel for machinery, filter changes etc.) is not included. Consumption of process additives/chemicals (e.g. lime, ammonia, etc.) necessary for incineration (emissions reduction) is included. Construction of capital goods e.g. buildings and machinery at the waste treatment facility is not included. Auxiliary facilities and operations such as offices and work travel are not included.

About Data	This dataset is part of the Swedish Waste Management Environmental Assessment (SWEA) LCA model of the Swedish waste treatment system (Björklund et al. 2009; Arushanyan et al. 2013). The SWEA model covers several waste fractions and several waste treatments. It was developed in the Towards Sustainable Waste Management - TOSUWAMA (Hållbar Avfallshantering) research programme, funded by Swedish EPA (Naturvårdsverket) running 2006-2013 (Ekvall et al. 2006). The main contributors to the SWEA model: Ola Eriksson - Gävle University (HiG); Anna Björklund, Christine Ambell, Yevgeniya Arushanyan - Environmental Strategies Research, Royal Institute of Technology (FMS KTH); Jan-Olof Sundqvist, Åsa Stenmark, Maria Ljunggren Söderman - Swedish Environmental Institute (IVL) This dataset is part of several datasets from the SWEA model published in CPM LCA Database. The datasets are: Waste treatment - SWEA model - incineration in combined heat and power plant (CHP) Waste treatment - SWEA model - incineration in heat only boiler plant (HOB) Waste treatment - SWEA model - incineration for heat in cement kiln (CKN) Waste treatment - SWEA model - reactor composting (CPR) Waste treatment - SWEA model - windrow composting (CPW) Waste treatment - SWEA model - landfill (LFL) More information about the TOSUWAMA project is available at

	www.hallbaravfallshantering.se. This dataset was documented in the CPM LCA Database by Johan Tivander, Environmental Systems Analysis, Chalmers University of Technology, Sweden. Review by Johan Tivander considers CPM LCA Database documentation criteria.

Availability	Public

Technical System	
Name	Waste treatment - incineration in heat only boiler plant (SWEA HOB)
Functional Unit	1 kg waste fraction to incineration in HOB plant
Functional Unit Explanation	Data for the several separate waste fractions are available (see Technical system description).
Process Type	Gate to grave
Site	Sweden
Sector	Waste treatment
Owner	Sweden
Technical system description	This dataset represents Swedish BAT conditions in the period 2007-2010 for incineration of waste in heat only boiler plants (HOB). It is a generic model applied to several waste fractions. The emissions from incineration are modeled for the incineration of the waste mix and further allocated to the specific waste fractions. Using data for incineration of only one specific fraction would not reflect the real situation, since the emission data for each fraction is valid in case of co-combustion with other fractions. Primary waste fractions: Animal waste from food industry (Animal), Paper and cardboard containers (Cardb), Corrugated cardboard (Corrb), Discarded equipment including mainly metals and small amounts of plastic and rubber. Modeled as "metal mixed" (Equip), Pulp (FibreRej), Food waste (Food), Glass container clear (GlaCl), Glass container coloured (GlaCol), Hazardous waste from households waste bags (Haz_h), Other industrial effluent sludges inorganic (IndSlNOrg), Chemical sludges and biosludges from industry 50%/50% (IndSlOrg), Concrete, stone, bricks, not recycable (InMix), Metal waste, excluding the metal scrap from manufacturing, excluding return cans. The mix is: Aluminium 5%, ferrous metals (steel) 90%, stainless steel 2%, other metals modeled as copper 3% (Metal), Mixed municipal solid waste, the fractions and their shares are given in the corresponding data set (mixed MSW), Newsprint, journals, and catalogues (Newspr), Sanitary products (diapers) and other combustible wood waste 24%/74% (OthComb_h), Paper and cardboard containers 14%, corrugated cardboard 30%, newsprint, journals and catalogues 42%, office paper 14% (Paper), Park and yard waste with high heating value (Park), Park and yard waste with low heating value (Park_h), Polyethylene, soft packaging (PE), PE 40%, PP 15%, PET 4%, PS 4%, PVC 11%, PUR 13%, PC 13% (Plastics), Plaster as bulky waste from households (Plastr), Polystyrene (PS), Fibre recycling reject (RecFibRej),

	Rubber (Rubber), Public sewage sludge - digested (SewSludge), Textile, production waste (Text), Vegetal waste from food processing (Vegetal), Wood excl. Transport pallets, excl. By-products e.g.reject from sawmill and tree felling, excl. Secondary wood waste from public recycling stations ÅVC (Wood) Secondary waste fractions: Reject from anaerobic digestion (Incineration HOB digrej) - (Animal, Foods, IndSludgeOrg, Manure, Vegetal) Reject from reactor composting (Incineration HOB reactor compost reject) - (Animal, Foods, Vegetal) Reject from windrow composting (Incineration HOB windrow compost reject) - (Manure, Park 1, Park 2, SewSludge) This model covers activities at the HOB plant. Waste collection (sorting and transporting) of incoming waste goods to the plant is not included. Output heat energy is considered as delivered onto local district heating grid. Energy losses after point of delivery on the grid are not included The amount of ash and sludge generated is stated but treatment of this secondary waste in e.g. landfills is not included. For the secondary treatment of ash and sludge see the corresponding type of treatment e.g. landfill. That is, process models need to be linked in series. Internal technical system considered: The data reflect Swedish HOB plants' average operations. The incineration furnace is assumed to be operating with a mix of all the waste fractions. Emissions and energy output are however provided for each specific waste fraction separately. Internal energy consumption at the plant is included. Internal material consumption at the plant (e.g. greasing, filter changes etc.) is not included. Consumption of process additives/chemicals (e.g. lime, ammonia, etc.) necessary for incineration (emissions reduction) is included. Construction of capital goods e.g. buildings and machinery at the waste treatment facility is not included. Auxiliary facilities and operations such as offices and work travel are not included.

System Boundaries

Nature Boundary	
Time Boundary	The modelled data is an approximation of BAT in Sweden in the period 2007-2010
Geographical Boundary	The model reflects the waste treatment system in Sweden.
Other Boundaries	See Technical system description
Allocations	As a base case, allocation is done on a material flow (mass) basis. That is, emissions are calculated in relation to the amount of a substance in each waste fraction. This is done for substances that are not transformed, where there is a mass balance. Other emissions are calculated in other ways depending on what was deemed the most relevant (allocated per MJ, or per total mass of the waste fraction). For landfill and incineration this is documented in Anna Björklund's licentiate thesis (Björklund A, 1998).
Systems Expansions	N/A

Technical System	
Name	Waste treatment - landfill (SWEA LFL)
Functional Unit	1 kg waste fraction to landfill
Functional Unit Explanation	Data for the several separate waste fractions are available (see Technical system description).
Process Type	Gate to grave
Site	Sweden
Sector	Waste treatment
Owner	Sweden
Technical system description	This dataset represents Swedish BAT conditions in the period 2007-2012 for landfill of waste (LFL). It is a generic model applied to several waste fractions. The emissions are modelled for two time frames - surveyable time (100 years) (ST) and remaining time (hypothetical infinity) (RT). A surveyable period is the period until a pseudo steady-state in the landfill processes is obtained. This period is typically of the magnitude of one century. A hypothetical, infinite time period is the period from the start until the landfilled material is completely released to the environment. These time frames are presented in separate datasets: ST- surveyable time only including emissions from ST, RT - remaining time only including emissions from RT. To calculate total emissions over ST and RT, the two data sets need to be added. Primary waste fractions: Other chemical wastes and residues from households (e.g. medicines, mixed chemical waste) and industry (mainly pulp), non hazardous, inorganic. Modeled as green liquor (grönlutslam) because most of it comes from pulp (Chemical, Chemical RT), Glass container clear (Glass Clear, Glass Clear RT), Glass container coloured (Glass Color, GlassColor RT), Other industrial effluent sludges inorganic (IndSlNOrg, IndSlNOrg RT), Concrete, stone, bricks, not recycable (InMix, InMix RT), Other ashes from incineration, non-recyclable (OtherAshes, OtherAshes RT), Plaster as bulky waste from households (Plaster, Plaster RT), Steel slag from steel industry, non-recyclable (SlagNRec, SlagNRec RT), Steel slag from steel industry, recyclable (SlagRec, SlagRec RT), Sorting ashes (SortAsh RT), Wood flyashes - biofuel ashes (WoodFlAsh, WoodFlAsh RT) Secondary waste fractions: Landfilling of ash from the incineration in Cement Kiln (Ash landfill Cement kiln) - (Industrial sludge org, PE, plastics, PS, rubber, Untreated wood) Landfilling of ash from the incineration - CHP - of the anaerobic digestion reject (Ash landfill CHP Digester reject) - (Animal) Landfilling of ash from incineration - CHP or HOB (Ash landfill from Incineration, ST) - (Animal, Cardboard, Corrugated cardboard, Fibre Reject, Foods, Glass Clear, Glass Color, Hazardous-chemical has, IndSludgeNOrg, IndSludgeOrg, Inert mix, Metal, Newsprint, Other comb, Paper, Park, Park_h-low HHV, PE, PS, Reused Fibre Reject, Rubber, Textile, Vegetal, Wood Landfilling of ash from incineration - CHP or HOB - of windrow composting - CPW - reject (Ash landfill incineration CPW reject - Garden waste, Industrial sludge org, Manure, Park-garden waste, Sew sludge) Landfilling of ash from the incineration - CHP - of the anaerobic digestion reject (Slag landfill CHP Digester reject) - (Animal) Landfilling of slag from incineration - CHP or HOB, slag composition same from CHP and HOB (Slag landfill from Incineration) - (Animal, Cardboard, Corrugated cardboard, Fiber Reject, Foods, Glass clear, Glass Colorr, Hazardous-chemical has, IndSludgeNOrg, IndSludgeOrg, Inert mix, Metal, Newsprint, Other comb, Paper, Park-high HHV, Park_h-low HHV, PE, Plastics, PS, RecFiber Reject, Rubber, Textile, Vegetal , Wood) Landfilling of slag from incineration (CHP or HOB) of the windrow composing - CPW - reject (Slag landfill Incineration CPW reject - Garden waste, Industrial sludge org, Manure, Park-garden waste, Sew sludge) This model covers activities at the landfill. Waste collection (sorting and transporting) of

	incoming waste goods to the landfill is not included. For the waste fraction 'Inorganic industrial sludge' energy is recovered. Inorganic industrial sludge has been defined as containing 2.2 % cellulose (based on DM). There is 25 % water in this fraction. Cellulose is then degraded in the landfill producing landfill gas which is extracted and combusted giving heat and electricity and considered as avoided products. Internal technical system considered: The data reflect Swedish landfills' average operations. The landfill is assumed to be a mix of all the waste fractions. Inputs and outputs are however provided for each specific waste fraction separately. Internal energy consumption for operating the facility is included. Internal material consumption for operating the facility is not included. Construction of capital goods e.g. buildings and machinery at the waste treatment facility is not included. Auxiliary facilities and operations such as offices and work travel are not included.

SPINE LCI dataset: Waste treatment - reactor composting (SWEA CPR)

Administrative	
Finished	Y
Date Completed	2013-03-18
Copyright	CPM LCA Database - free to use but not to resell the data
Availability	Public

Technical System	
Name	Waste treatment - reactor composting (SWEA CPR)
Functional Unit	1 kg waste fraction to reactor composting

Functional Unit Explanation	Data for the several separate waste fractions are available (see Technical system description).
Process Type	Gate to grave
Site	Sweden
Sector	Waste treatment
Owner	Sweden
Technical system description	This dataset represents Swedish BAT conditions in the period 2007-2010 for reactor composting of waste (CPR). It is a generic model applied to several waste fractions: Animal waste from food industry (Animal), Food waste (Food), Park and yard waste with low heating value (Park_h), Vegetal waste from food processing (Vegetal) This model covers activities at the reactor composting facility. Waste collection (sorting and transporting) of incoming waste goods to the plant is not included. Heat energy generated is used for district heating and hence considered as avoided heat production. Compost is generated as a waste treatment product; reject from CPR is generated as secondary waste. Further usage of the compost product in soil manufacture and secondary waste treatment of the reject (incineration in CHP plant) are not included. For the processes of compost use and incineration of the reject in CHP plant see corresponding data sets. That is, process models need to be linked in series. Internal technical system considered: The data reflect Swedish CPR facilities' average operations. The compost reactor is assumed to be operating with a mix of all the waste fractions. Emissions and energy output are however provided for each specific waste fraction separately. Internal electricity and fuel consumption for operating the facility is included. Internal material consumption for operating the facility is not included. Construction of capital goods e.g. buildings and machinery at the waste treatment facility is not included. Auxiliary facilities and operations such as offices and work travel are not included.

Technical System	
Name	Waste treatment - windrow composting (SWEA CPW)
Functional Unit	1 kg waste fraction to windrow composting
Functional Unit Explanation	Data for the several separate waste fractions are available (see Technical system description).
Process Type	Gate to grave
Site	Sweden
Sector	Waste treatment
Owner	Sweden
Technical system description	This dataset represents Swedish BAT conditions in the period 2007-2010 for windrow composting of waste (CPW). It is a generic model applied to several waste fractions: Chemical sludges and biosludges from industry 50%/50% (IndSlOrg), Manure, excluding the one used in the gardens (Manure), Park and yard waste with high heating value (Park), Public sewage sludge - digested (SewSludge) This model covers activities at the windrow composting facility. Waste collection (sorting and transporting) of incoming waste goods to the plant is not included. Compost is generated as a waste treatment product; reject from CPW is generated as secondary waste. Further usage of the compost product in soil manufacture and secondary waste treatment of the reject (incineration in CHP plant) are not included. For the processes of compost use and incineration of the reject in CHP plant see corresponding data sets. That is, process models need to be linked in series. Internal technical system considered: The data reflect Swedish CPW facilities' average operations. The windrow compost is assumed to be operating with a mix of all the waste fractions. Emissions and product output are however provided for each specific waste fraction separately. Internal electricity and fuel consumption for operating the facility is included. Internal material consumption for operating the facility is not included. Construction of capital goods e.g. buildings and machinery at the waste treatment facility is not included. Auxiliary facilities and operations such as offices and work travel are not included.

System Boundaries	
Nature Boundary	
Time Boundary	The modelled data is an approximation of BAT in Sweden in the period 2007-2010
Geographical Boundary	The model reflects the waste treatment system in Sweden.
Other Boundaries	See Technical system description
Allocations	As a base case, allocation is done on a material flow (mass) basis. That is, emissions are calculated in relation to the amount of a substance in each waste fraction. This is done for substances that are not transformed, where there is a mass balance. Other emissions are calculated in other ways depending on what was deemed the most relevant (allocated per MJ, or per total mass of the waste fraction). For landfill and incineration this is documented in Anna Björklund's licentiate thesis (Björklund A, 1998).
Systems Expansions	N/A

Flow Data
General Activity QMetaData

Date Conceived	2010
Data Type	Modeled data
Represents	Swedish BAT average operating conditions
Method	Inventory data was mainly collected from literature studies and results from previous related projects. Data has been remodeled to match the scope of SWEA. Some emission flow data were calculated with the ORWARE model (Björklund 1998; Eriksson et al. 2002).
Literature Reference	Download file with flows for all waste fractions at http://cpmdatabase.cpm.chalmers.se /DataReferences/SWEA LCI process data.xlsx Arushanyan Y , Björklund A, Eriksson O, Finnveden G, Ljunggren Söderman M, Stenmarck Å. Applicability	For applicability for the process see 'Technical system description' and 'System Boundaries' above
About Data	This dataset is part of the Swedish Waste Management Environmental Assessment (SWEA) LCA model of the Swedish waste treatment system (Björklund et al. 2009; Arushanyan et al. 2013). The SWEA model covers several waste fractions and several waste treatments. It was developed in the Towards Sustainable Waste Management - TOSUWAMA (Hållbar Avfallshantering) research programme, funded by Swedish EPA (Naturvårdsverket) running 2006-2013 (Ekvall et al. 2006). The main contributors to the SWEA model: Ola Eriksson - Gävle University (HiG); Anna Björklund, Christine Ambell, Yevgeniya Arushanyan - Environmental Strategies Research, Royal Institute of Technology (FMS KTH); Jan-Olof Sundqvist, Åsa Stenmark, Maria Ljunggren Söderman - Swedish Environmental Institute (IVL) This dataset is part of several datasets from the SWEA model published in CPM LCA Database. The datasets are: Waste treatment - SWEA model - incineration in combined heat and power plant (CHP) Waste treatment - SWEA model - incineration in heat only boiler plant (HOB) Waste treatment - SWEA model - incineration for heat in cement kiln (CKN)

	Waste treatment - SWEA model - reactor composting (CPR) Waste treatment - SWEA model - windrow composting (CPW) Waste treatment - SWEA model - landfill (LFL) More information about the TOSUWAMA project is available at www.hallbaravfallshantering.se. This dataset was documented in the CPM LCA Database by Johan Tivander, Environmental Systems Analysis, Chalmers University of Technology, Sweden. Review by Johan Tivander considers CPM LCA Database documentation criteria.

SPINE LCI dataset: Vattenfall electricity production system

Administrative	
Finished	Y
Date Completed	1996-12-01
Copyright	
Availability	Public

Technical System	
Name	Vattenfall electricity production system
Functional Unit	1 kWh
Functional Unit Explanation	Production of 1 kWh electricity
Process Type	Other
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	The electricity production system of Vattenfall consists of a large number of power plants based on different technique and with very different environmental impact. The system is a combination of base, control and peak power where the different power sources complement each other. Nuclear and hydropower is the base for the system of Vattenfall. Hydropower is also used for control power. When the control possibilities of the water power are not sufficient, other power sources are used in the following order: nuclear power, combined heat and power, import, oil condensing power and oil fired gas turbine power. Combined heat and power is used as base, principally during the winter half, when the need for both heat and power are the largest. Oil fired condensing plants is used for seasonal and long-term needs for reserve power. Gas turbine power plants are primarily reserve power for very short term needs.

System Boundaries	
Nature Boundary	
Time Boundary	The data is fairly representative of the electricity production of Vattenfall AB over the last 10-15 years.
Geographical Boundary	The electricity is produced in Sweden.
Other Boundaries	
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1996
Data Type	Unspecified
Represents	Swedish BAT average operating conditions
Method	The share of the different power sources of the total electricity production have been calculated by dividing the total electricity production of each power source with the total electricity production by Vattenfall AB during 1995. The total electricity production in the power plants of Vattenfall AB were 75 718 GWh. The data can be found in Brännström-Norberg B-M et.al.
Literature Reference	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S.,''Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport'', Vattenfall AB
Notes	The power sources that produce the different shares of electricity can be found under Notes for each specific flow into the system.

About Inventory

Publication	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S.,''Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport'', Vattenfall AB Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology
Intended User	
General Purpose	
Detailed Purpose	To calculate the total environmental impact of the electricity production system of Vattenfall AB, using life cycle analysis of the different power sources.
Commissioner	- Vattenfall Elproduktion .
Practitioner	- Vattenfall Energisystem AB: Britt-Marie Brännström-Norberg Ulrika Dethlefsen Roland Johansson Caroline Setterwall Sofie Tunbrant .
Reviewer	- Thomas Ekvall, Chalmers Industriteknik (CIT) Gunnar Lindfors, Institutet för Vatten- och Luftvårdsforskning (IVL) Göran Finnveden, Institutet för Vatten- och Luftvårdsforskning (IVL)
Applicability	The data represents the electricity production of Vattenfall in 1995, which is a fairly representative year. The share of the different power sources varies from year to year, depending on primarily the supply of hydropower. Since 10-15 years, almost all of the electricity has been produced by hydropower and nuclear power. The share of fossil power has been low. The following data can be used to calculate the environmental impact of the electricity production system: *Hydropower* - data for hydropower in Brännström-Norberg B-M et al.

	Nuclear power - data for nuclear power in Brännström-Norberg B-M et al. *Combined heat and power, bio fuel* - data for the combined heat and power fired with wood fuel in Brännström-Norberg B-M et al. can be used. *Combined heat and power, coal* - data for fuel production and operation of the power plant can be found in Brännström-Norberg, Rosén-Lidholm et al. ''Analys av miljökonsekvenser för ett kraftvärmeverk eldat med salix - jämförelse med miljökonsekvenserna för kol och skogbränsle'' Vattenfall Utveckling AB, Projekt Bioenergi 1994/3 *Combined heat and power, peat* - data for the fuel production of wood fuel (in the analysis of Combined heat and power, bio fuel) in Brännström-Norberg B-M. et al. can be used. For the operation of the plant, the environmental report of ''Uppsala energi'' can be used. *Combined heat and power, natural gas* - data for fuel production and operation of the power plant can be extrapolated from the data for a natural gas fired combination plant in Brännström-Norberg B-M et al. *Combined heat and power, oil* - data for the fuel production can be found in the analysis for the oil condensing power plant in Brännström-Norberg B-M et al. *Oil condensing power* - data for an oil condensing plant can be found in Brännström-Norberg B-M et al. *Gas turbine power* - data for a gas turbine power plant can be found in Brännström-Norberg B-M. et al. *Wind power* - data for a wind power plant can be found in Brännström-Norberg B-M. et al.

SPINE LCI dataset: Vessel Göteborg to Halmstad

Administrative	
Finished	Y
Date Completed	1999-04-20
Copyright	
Availability	public

Technical System	
Name	Vessel Göteborg to Halmstad
Functional Unit	14 394 m3 pre-treated waste oil transported from Göteborg to Halmstad.
Functional Unit Explanation	The vessel is half loaded when carrying out the transports. The calculation of the emissions are based on the known specific fuel consumption.
Process Type	Gate to gate
Site	
Sector	Sea transport
Owner	

Technical system description	The transportation of pre-treated waste oil from Göteborg to Halmstad, 140 km. The density for the waste oil is 0,93 ton / m3 due to the water pollution. The total amount of waste oil transported during 1997 was 14 394 m3. The transportation step consumes fuel oil and releases emissions to the system environment. The ship size is below 2000 dwt and the transports are assumed to be carried out half loaded. The transportation step consumes fuel and releases emissions to the system environment.

System Boundaries

Nature Boundary	Only emissions legeslated by law is represented by NTM.
Time Boundary	The study only deals with retrospective data and no attempts are made to predict future events or conditions. 1997 is assumed as a suitable time frame to collect and interpret data.
Geographical Boundary	The geographical boundary is set to Sweden.
Other Boundaries	The loading and unloading steps are neglected in terms of resource use and emissions. The environmental impact from capital goods and activities serving the process are neglected e.g. personell, infrastructure and facilities. Moreover, maintenance and wear down of the system are neglected. It is assumed the there occurs no spill.
Allocations	
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1998-12-29
Data Type	Derived, unspecified
Represents	Swedish BAT average operating conditions
Method	NTM presents data about emissions that are released for vessels (< 2000 dwt, half loaded with cargo) that consumes 8,8 g fuel / tonkm. The vessel that is employed by Reci however consumes 7,6 g fuel/ tonkm (Bengt Borg) i.e. 85,9 per cent of the presented data. Therefore the calculations anticipate that the emissions are 14,1 per cent smaller. NOx, HC, PM, CO, CO2 and SO2 are presented in grams released per tonkm (NTM). The density for fuel is 0,89 kg / litre and 4,45 kWh / litre fuel. (NTM). The transportation of pre-treated waste oil from Göteborg to Halmstad, 140 km. The density for the waste oil is 0,93 ton / m3 due to the water pollution. The total amount of waste oil transported during 1997 was 14 394 m3.
Literature Reference	http://www.ntm.a.se/emissioner/ship/data/lastfartyg_mindre.htm, last uppdated 1998-09-08 Bengt Borg, Production Manager, Reci Industri AB in Halmstad
Notes	The power sources that produce the different shares of electricity can be found under Notes for each specific flow into the system.

About Inventory

Publication	Master thesis: ''LCA on converted fuel oil'' by Daniel Strandberg and Christer Wik Technical Environmental Planning, Chalmers University of Technology
Intended User	Internal use at Reci Industri
General Purpose	The objective of this study was to carry out a Life Cycle Assessment for converted fuel oil. The analysis involves outlining the environmental hazardous steps in the production. The result is used internally to aid as an environmental improving guidance as well as to receive a better view of the process. Externally, the result is a part of the Reci's ISO 14 000

	certification which acts a guarantee to the costumes. The quality of the inquiry is set due the standards of a Master of Science thesis.
Detailed Purpose	To estimate the resource use and emission released from the vessel during transportation.
Commissioner	Schaff, Lars, environmental manager - Reci Industri AB Box 48047 418 21 Göteborg Sweden.
Practitioner	Strandberg, Daniel and Christer Wik - MSc students Technical Environmental Planning Chalmers University of Technology 41296 Göteborg Sweden.
Reviewer	Beckman, Torsten - Technical environmental planning Chalmers University of Technology 412 96 Göteborg Sweden
Applicability	The data are specific for coastal transportations that are carried out for Reci by smaller vessels (2000 DWT)
About Data	If data is utilised from this thesis it should be conducted with prudence. For receiving a more sufficient result for another activity, measurement should be utilised for each specific item in the production chain. However, the data represented in this study is of sufficient quality for being conducted when benchmarking.

SPINE LCI dataset: Wheat cultivation. ESA-DBP

Administrative	
Finished	Y
Date Completed	2005
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System	
Name	Wheat cultivation. ESA-DBP
Functional Unit	1 kg of wheat
Functional Unit Explanation	1 kg of wheat on the yield where 3400kg/ha can be cultivated
Process Type	Gate to gate
Site	Unknown
Sector	Crop and animal production, hunting etc.
Owner	Unknown
Technical system description	The wheat cultivation was investigated in the study, because (excerpt from the report, see 'Publication') ''it has been shown that using peas as a precursor crop to winter wheat can increase the yield of winter wheat substantially, from about 6 000 kg/ha to 7 000 kg/ha. (...) However, it is not recommended that peas are cultivated more often than every seventh or eighth year, in order not to ruin the benefits achieved from crop rotation. In this study we assume that the extra wheat generated replaces cultivation of winter wheat in a cereal crop rotation. Apart from increasing the yield, peas can also reduce the need for pesticides in the subsequent crop. This process is included in the system described in: Abelmann A. (2005). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf Other processes in the CPM Database also included in the above publication: - Sausage (Soy-Dog) production. ESA-DBP - Sausage (Pea-Dog) production. ESA-DBP - Sausage (Hot-Dog) production. ESA-DBP - Operation of 'Hot Dogs' producing facility. ESA-DBP - Pea cultivation. ESA-DBP - Production of beef. ESA-DBP - Production of pork. ESA-DBP - Rape seed cultivation. ESA-DBP - Sugar beet cultivation. ESA-DBP - Soy bean processing. ESA-DBP - Soy bean cultivation. ESA-DBP

System Boundaries	
Nature Boundary	Data include use of energy, as well as emissions to air and water.
Time Boundary	Data were acquired in 2004 as the most up-to-date ones..
Geographical Boundary	The study was done for Sweden.
Other Boundaries	Excerpt from the report, see 'Publication': ''Not included are any aspects regarding personnel. (...) Pesticides, fungicides and herbicides are only taken into account quantitatively in the inventory section in this study (when data have been available), but are not analysed further in the results section. (...) some ingredients in the food processes have been judged to contribute very little to the overall process, and have therefore been excluded.

Allocations	No information about the allocation in the report.
Systems Expansions	Not applicable

About Inventory

Publication	Abelmann A. (2005). Environmental Potential of Increased Human Consumption of Grain Legumes. An LCA of food products. Master thesis. ESA report 2005:10, ISSN: 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2005--10.pdf
Intended User	LCA practitioner
General Purpose	Excerpt from the report, see 'Publication': ''The overall aim of the study is to assess the potential environmental impacts of substituting animal protein for regionally grown vegetable protein in food products.''
Detailed Purpose	Excerpt from the report, see 'Publication': ''The objective is to analyze three food products of the same type, and the purpose is to compare the environmental impact of the products and also to identify the most important contributors of the total environmental impact of each product. The products are described as follows. - a product in which all protein is animal protein. - a product in which 10% of the animal protein is replaced with vegetable protein. - a product in which all protein is vegetable protein. Furthermore, the objective is to provide useful information on the products that can be used in other environmental systems analysis, e.g. in meal studies.
Commissioner	Swedish Institute of Food and Biotechnology (SIK AB), Sweden - .

SPINE LCI dataset: Wind electricity energy system, EPD-version

Administrative	
Finished	Y
Date Completed	1996-10
Copyright	Bundesamt für Energie, Bern
Availability	Public

Technical System	
Name	Wind electricity energy system, EPD-version
Functional Unit	1 TJ net electricity from power plant
Functional Unit Explanation	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
Process Type	Cradle to grave
Site	Switzerland
Sector	Grid electricity and district heat
Owner	Switzerland
Technical system description	Reported figures are based on data from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, ''Ökoinventare von Energiesystemen'', 3rd edition 1996 and modified to fit UCPTE conditions and adapted to the demands of the EPD-guidelines (Environmental Product Declaration guidelines in Sweden). -- Brief description -- One wind power plant with an output of 30 kW has been inventoried in detail and two other plants (30 kW and 150 kW) also have been analysed with the help of the detailed study together with specific data for those plants. Construction, demolition and operation of the plants have been studied. The yield of studied plants is about 50% lower than the yield of plants at more windy locations at for instance the sea coast. Data has been aquired from literature and from a manufacturing plant for wind power plants and figures concerning consumption of energyware and materials, use of land and water, emissions to air and water and wastes have been picked out from or calculated based on those sources for all phases of the life cycle. All subsystems are described on a ''cradle-to-grave'' basis, including the main stages, i.e. data concerning consumption of resources and emissions is included for the manufacturing of main materials, waste handling and energyware used in the lifecycle. Energyware (fuels and electricity) is used during construction (ground works), in material manufacturing processes, transports etc. -- Detailed description -- Construction and demolition of power plant (30kW/30kW/150kW) The plants consists of a 18/22/30 m high tower made of painted, galvanized steel with a basal of reinforced concrete. Further the plant has a rotor (diameter 12,5m/12,5m/23,8m) with two/two/three blades made of glass fibre reinforced plastic, a generator and a gear box, a break, a hydraulic system (12 l oil) and electronics.

	Material production, component production, galvanization, transports, welding and ground work (incl. blasting) are included. Several materials are assumed to be recycled after dismantling the rest is put in landfills or is left in the ground (basal). Operation of power plant The change of gear oil (20 l) every 4 years as well as transportion is included. The electricity generation of the three plants is listed below together with the approximate share of respective wind mill type in the Swiss wind electricity mix, adapted to the real set of Switzerlands 7 grid connected wind mills: Power Yield Share Operation time (full load) 30kW 20 864 kWh 15% 695 h 30kW 14 868 kWh 11% 496 h 150kW 99 964 kWh 74% 666 h For here reported figures the average operation time has been doubled (after recommendation of Dr. Rolf Frischknecht) to better correspond to the UCPTE situation i.e. resulting figures are 50% of those reported in the original study. * Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

System Boundaries	
Nature Boundary	Used materials and energyware have been followed from extraction and processing of natural resources. Maufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included). ETH:s LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH. Vattenfall's criterion in selecting and aggregating ETH's LCI-results for electricity generation in the UCPTE region has been to make the figures usable as general electricity LCI data in EPDs according to Miljöstyrningsrådets guidelines. Especially parameters (emissions) which have established impact indices - accepted by the EPD system - for one or several environmental impact categories, have been picked out and aggregated as far possible. But also metal and energyware resources have been included, as well as waste, in spite of all waste handling processes related to this dataset being included with respect to use of resources and emissions. The latter is an adaption to other LCI data for electricity generation where waste amounts are reported (since those flows have not been followed to the grave). Since ETH claimes that most of the figures regarding metal emissions have an undefined amount of datagaps all metal emissions are aggregated except for a few which are specified separatly since they are reported for most processes in the lifecycle. Metals are reported as elements although they often are part of compounds. Measuring methods often just give the amounts of the different elements found. All hydrocarbons to water are aggregated to one parameter as well as halogenated organics, since no indices exist (that are accepted by the EPD system so far) for characterisation of the individual substances.
Time Boundary	Different technical lifetimes/reference times for different parts of the studied systems have been used as follows: Moving parts 20 years Fixed parts 50 years
Geographical Boundary	No geographical boundaries have been drawn except concerning the location of the studied plants in Switzerland and the consumption of generated electricity in the UCPTE* region. All transports with wind mill parts are assumed to come from Germany. Processes conducted outside the UCPTE* region are supposed to be supplied with UCPTE* electricity. Data concerning the use of resources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries. * Union pour la coordination de la production et du transport de l'életricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Jugoslavia (Bosnia/Herzegowina, Croatia, Slowenia, and Rest-Jugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.
Other Boundaries	Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPTE electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more

	thorough calculations in ETH:s LCA for coal power. The ETH study comprises figures concerning use of land, usable content in water storages and amount of turbine water which have not been reported here. The two latter have been excluded due to lack of corresponding data in comparable studies. Use of land has been excluded here because of ETH's advanced approach. Land is divided into two main groups - land and sea - which are subdivided into 4 categories each. Land Criterion Category Natural human impact not larger than other species' since the indutrial revolution I Modified human impact larger than other species', low degree of culivation II Cultivated human impact larger than other species', large degree of cultivation III Built upon dominated by buildings, roads, dams, mines etc. IV Category I is not used in the study. State of land before, during and after exploitation is of intererst. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one. ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. they express use of land in the unit m2year which is diffrent from comparable Swedish studies (m2). See times for restoration of land below: From category IV to category III 5 years From category III to category II 50 years From category II to category I 100 000 years (For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.) ETH specifies about 160 radioactive isotopes emitted to air and water. Radioactive emissions reported here are picked out in accordance with SETAC working group report on data quality and data availability (to be published in 2001). Big accidents occuring seldomly are not included.The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.
Allocations	The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.
Systems Expansions	

Flow Data

General Activity QMetaData

Date Conceived	1985 to 1995
Data Type	Derived, unspecified
Represents	Approximate average wind power in the UCPTE in 1994.
Method	The data has been adapted from the Ökoinventare von Energiesystemen, ETH Zürich 1996, and is an aggregation of the LCI results for the module ''Electricity from wind power, Switzerland'' (Windmix CH) (divided by two since operation times in Switzerland are very low in comparison to the average in the UCPTE).

Notes: Internal flow! Infrastructure (resources and emissions) included, as well as emissions from incineration plant.	Output	Residue	Waste to incineration	25.45			kg	Technosphere	

About Inventory

Publication	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at http://www.energieforschung.ch.

	--- Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden Documentation reviewed by (see also Notes): Rolf Frischknecht, ESU-services, Switzerland Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden ---
Intended User	Original study of ETH: LCA pra
General Purpose	The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their lifecycles. The results can be used in lifecycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans. Vattenfalls purpose - as a commissioner of putting ETH:s data into Spine format with metadata - is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines. Data is supposed to be used together with IEA statistics about electricity generation mixes in the OECD countries/regions.
Detailed Purpose	ETH:s aim was to examine some important aspects of the environmental impact of wind power plants in Switzerland with respect to construction, operation and demolition.
Commissioner	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
Practitioner	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villingen/Würenlingen .
Reviewer	None, see further under notes -
Applicability	Here reported LCI-results of wind power are supposed to be valid for the UCPTE. This set of data is aggregated and documented in accordance with the Swedish EPD-guidelines to be used in combination with IEA statistics concerning electricity generation mixes in OECD countries and regions together with other datasets - based on the ETH study - describing other power generation systems. The EPD-adapted power generation systems in Spine format are named as follows: Fuel gas electricity energy system, EPD-version Biofuel electricity energy system, EPD-version Hydro electricity energy system, EPD-version Lignite electricity energy system, EPD-version Nuclear electricity energy system, EPD-version Stone coal electricity energy system, EPD-version Wind electricity energy system, EPD-version IEA statistics for generation mixes 1998 exist in Spine format for the following 30 countries/regions: OECD total OECD North America OECD Pacific OECD Europe European Union Australia Austria Belgium Canada Czech Rpublic Denmark Finland France Germany Greece Hungary Iceland Ireland Italy Japan Korea Luxembourg Mexico Netherlands New Zealand Norway Poland Portugal Spain Sweden Switzerland Turkey United Kingdom United States

About Data	For an application of ETH data for wind power in UCPTE countries, the production volume per installed kW is doubled, since operation time in Switzerland is much lower than average operation times of wind power plants in the UCPTE. Hence emission and resource consumption figures reported here are 50% lower compared to the original data in the ETH study, which only covers the Swiss situation. Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided). Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16). For references and sources of reported figures see further under Function, Nature boundary, Geographical boundaries, Publication, Notes and General metadata.
Notes	Reviewer of this specification of ETH:s data and metadata has been: Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of aggregation of figures and of Vattenfall's interpretation ot the documentation Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data documentation requirements. The technical committee of the Swedish Environmental Management Council - approval of method and aggregation of parameters Project Management of the ETH study, 3rd edition: Professor, Dr. P. Suter and R. Frischknecht, ETH Editorial staff of the 1st edition: R. Frischknecht, P. Hofstetter, I. Knoepfel, M. Ménard, ETH R. Dones, E. Zollinger, Paul Scherrer Institut Authors of the 1st edition: N. Attinger, T. Baumann, G. Doka, R. Dones, R. Frischknecht, H.-P. Gränicher, C. Grasser, P. Hofstetter, I. Knoepfel, M. Ménard, H. Müller, M. Vollmer, E. Walder, E. Zollinger Authors of the revision, 3rd edition: U. Bollens, S, Bosshart, M. Ciot, L. Ciseri, G. Doka, R. Frischknecht, R Hischier, A. Martin, ETH R. Dones, U. Gantner, Paul Scherrer Institut -- --- Changes made to the data set after publishing in SPINE@CPM--- >>> 6 June 2001: <<< The following changes has been made in the nomenclature for in- and outflows: Mangane in ore -> changed to: Manganese in ore CH4 -> changed to: Methane (to be in accordance with the nomenclature specified in CPM report 2000:2) CN -> changed to: CN- Stone coal -> changed to: Hard coal (to be in accordance with the nomenclature specified in CPM report 2000:2) Other metals -> changed to: Metals Explanations of nomenclature (inserted in Notes for the specific flows): - CN- is Cyanide ion - Reactive waste deposit is waste at landfill that is still reactive. - Inert waste deposit is waste at landfill that are inert. Additional clarifications: - Note that the flows of waste in the table of in- and outflows are internal flows, i.e. they do NOT cross the system boundaries. All waste handling processes is included in the study with respect to use of resources and emissions. - Radioactive waste is accounted for in cubic metres. The product specific requirements for electricity and district heating generation (PSR 1998:1) in the Swedish EPD system states that waste shall be accounted for in gram. However, no conversion factors were given in the study. There are also no general conversion factors that are commonly used.

SPINE LCI dataset: Wind power plant with support systems

Technical System	
Name	Wind power plant with support systems
Functional Unit	Net production of 1 kWh electricity
Functional Unit Explanation	The emissions and use of resources and raw materials are associated with the net production of 1 kWh electricity.
Process Type	Cradle to gate
Site	Näsudden, Gotland
Sector	Grid electricity and district heat
Owner	Näsudden, Gotland
Technical system description	The studied system concerns the *operation and maintenance of a 500 kW wind power plant.* To represent the electricity production in Vattenfall:s wind-power plants, Nordic 500 have been used. The time of use, i.e. real operation time recalculated as operation time at full effect is assumed to be 1500 hours, giving an electricity production of 18750 MWh during an assumed life-time of 25 years. Production of materials, chemicals and electricity and transports, used in association with operation and maintenance of the plant are included. To operate the wind power plant, no resources are used except lubricating oil and fuels for transports. The components of the power plant can be recycled. At operation and maintenance, mainly steel and copper are replaced. Some of it is recycled, and the rest is assumed to be transferred to scrap handling or final waste. Vattenfall owns twelve wind power plants, on Gotland, at Lysekil on Utö in the archipelago off Stockholm and in Skåne. Together they produce 16 GWh electricty per year, which is 0,2 per mille of the electricity production of Vattenfall.

System Boundaries	
Nature Boundary	All emissions are considered equivalent, independent of where they take place (locally, regionally, globally; in densely populated areas or rural areas).
Time Boundary	A power plant of 500 kW is currently common. In the future, units of 1000-1500 kW will probably be more common.
Geographical Boundary	The plant is located on Näsudden, Gotland.
Other Boundaries	The studied system includes *operation and maintenance of a wind power plant of 500 kW*. Calculations concerning erection and demolition of the plant has been performed but are not included in this system. ***Sub-systems included in the system:*** • Internal use of electricity in the plant e g. for lighting and warning lamps are taken into account in the calculation for electricity production. • Use of resources and emissions associated with reinvestments and reconstruction, except bed (fundament) and blades. • Known use of chemicals are accounted for. In the cases where it was possible to obtain data, resource use and emissions for the production are included. • Use of resources and emissions to air from production of the electricity that is used in the life cycles, distributed on the different production alternatives. • Energy use and emissions for the production of oil for the studied manufacturing processes and transports. ***Sub-systems excluded from the system:***

	• Equipment after the power station transformer. • Waste and rest products are transported to final waste. Operation and chemical and biological decomposing processes in the final waste have not been considered. • The risk of major accidents and rare breakdowns and environmental consequences from these. • Work environment. • Environmental loads caused by the operation personnel (mainly transports to and from work.
Allocations	The *50/50 method* has been applied throughout the calculations. The method is described in ''Nordic Guidelines on Life-Cycle Assessment'', Nord 1995:20, The Nordic Council, Stockholm.
Systems Expansions	N/A (unless aggregated system from special type of comparative LCI study)

Flow Data

General Activity QMetaData

Date Conceived	1996-01-01
Data Type	Derived, unspecified
Represents	Approximate average wind power in the UCPTE in 1994.
Method	An LCA calculation of the operation and maintenance of an 500 kW wind power plant, with a time of use of 1500 hours.
Literature Reference	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S.,''Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport'', in Swedish, Vattenfall AB
Notes	The parameters that are presented are chosen because they have a general interest and because the basis for these parameters is relatively good. All values are reported with 3 figures. Data is however seldom that accurate.

About Inventory	
Publication	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S.,''Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport'', Vattenfall AB Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology
Intended User	The data can be used as a basi
General Purpose	• The work with life-cycle analysis is expected to *contribute to a reinforcement and structuring* of the environmental work within Vattenfall, and a deeper knowledge on the use of resources and emissions to the environment. • An LCA can *facilitate a need for reliable data for electricity production*. Electricity is used in the manufacture of almost every product, and data from an LCA can be used when conducting an LCA on products. • An LCA can *facilitate a choice between different techniques* for future electricity production. • An LCA can also help to *choose the most effective alternatives* to reduce the consumption of resources and environmental influence of the current electricity production system. • It is also possible to *compare* the environmental load for different alternatives of electricity production.
Detailed Purpose	To obtain a *reliable basis* to be able to perform life-cycle analyses of different types of electricity use, and to identify opportunities for improvements in the existing system. To identify data gaps and areas where the knowledge is poor.
Commissioner	- Vattenfall Elproduktion .
Practitioner	- Vattenfall Energisystem AB: Britt-Marie Brännström-Norberg Ulrika Dethlefsen Roland Johansson Caroline Setterwall Sofie Tunbrant .
Reviewer	- Thomas Ekvall, Chalmers Industriteknik (CIT) Gunnar Lindfors, Institutet för Vatten- och Luftvårdsforskning (IVL) Göran Finnveden, Institutet för Vatten- och Luftvårdsforskning (IVL)
Applicability	The analysis is based on data from a plant that is chosen to make the analysis representative for the operation and maintenance of Vattenfall:s wind power plants. The data is primarily valid for a wind power plant of 500 kW, which is an ordinary size today. Units of 1000-1500 kW will however shortly be on the market. The data is reliable since a specific plant has been studied. The consequence is however that the result is primarily valid for the studied plant. Thoroughly reliable data for every power source, requires life cycle analyses for a large number of power plants for every power source. Transmission and distribution losses are not included. When the result is used to study different types of electricity use, these losses should be included. A rough estimate are that the distribution losses for a large industry customer are approximately 5% of the bought electricity, i.e. to obtain data for the use of electricity the data should be multiplied with 1,05. For an average household customer the transmission losses are approximately 10% of the bought electricity, i.e. the data should be multiplied with 1,10. *If the result should be applied to another size of power plant* the material quantities need to be adjusted. A wind power plant on 500 kW has a tower height of 40 m, a rotor diameter of 40 m and calculated annual electricity production of 1100 MWh. For a power plant of 250 kW, tower height 32 m, rotor diameter 32 m and calculated annual production of 550 MWh, the material quantities are related as 0,8 to the material quantities of the 500 kW power plant. For a power plant of 1 MW, tower height 60 m, rotor diameter 60 m and calculated annual production of 2400 MWh, the material quantities are related as 1,5 to the

	500 kW power plant. The *operation time* varies depending on position and wind situation. The choice of time of use has a great influence on the result. The data apply to an operation time of 1500 hours. The environmental load for 1500 hour operation is 40% larger than for a 2500 hour operation time. The complete study include erection, operation and maintenance, and demolition of the power plant. When the data is used for energy production in a life cycle analysis of a product or a system, that do not require expansion of the electricity generation system, it is however reasonable to include only operation and maintenance of the plant. The other phases of the life cycle, i.e. erection and demolition, do not depend on the electricity production.
About Data	Data for the use of resources and energy are *specific for the operation of Nordic 500*, a power plant of 500 kW. The time of use, i.e. real operation time recalculated as operation time at full effect is assumed to be 1500 hours, giving an electricity production of 18750 MWh during the assumed life-time of 25 years. Calculations for an operation-time of 2500 hours, which gives an electricity production of 31250 MWh during 25 years, have been performed but are not reported. To operate the wind power plant, no resources are used except lubricating oil and fuels for transports. The components of the power plant can be recycled. At operation and maintenance, mainly steel and copper are replaced. Some of the metals is recycled, and the rest is assumed to be transferred to scrap handling or final waste. Since metals will be recycled to a large extent only a small part will go to final waste. These materials are not followed to the grave. The influence on the result because of this is difficult to assess. Relevant data for transports, extraction and production of metals and chemicals, and manufacture and work on important components were hard to obtain. Data from manufacturers and other reports and studies, primarily life cycle analyses have been used. Production of material and transports are considered with current technology. Swedish standard values have been used to calculate fuel use and emissions from transports. Transport distances are specific for the operation of the plant. *The parameters that are presented* are chosen because they have a general interest and because the basis for these parameters is relatively good. All values are reported with 3 figures. Data is however seldom that accurate. Use of resources and emissions associated with *reinvestments and reconstruction* are generally assumed to give an addition of 1 % per year of the use of resources and emissions at the building phase. The bed (fundament) and blades are however not considered to need renewal during the lifetime of the power station. The following data has been used in the analysis (tonnes per year during 25 years): Steel: 0,3 Copper: 0,008 PVC: 0,0005 Natural rubber: 0,0005 Lubricating oil: 0,005 For electricity used in the manufacture of materials and fuels, *average electricity* for the respective countries distributed on the different electricity production alternatives has been used. The following *degrees of efficiencies* have been used to calculate the fuel used in the electricity production. The values are standard values for existing power plants. New modern plants often have higher degrees of efficiencies. The values are calculated from the effective heating value in the used fuels and the energy content in the steam produced in a nuclear power plant. • Coal condensing: 40% • Oil condensing: 40% • Natural gas condensing/combination: 40% • Gas turbine: 25% • Combined heat and power plant(irrespective of fuel) 30%

	(for electricity production) 85% (total for electricity and heat production) • Hydro power: is not recalculated, is accounted for as kWh electricity • Nuclear power: 33%, is however not recalculated, but accounted for as kWh electricity or gram natural uranium.
Notes	Wind power is a temporary power source, only available when it is windy enough. Wind power influence the environment through an altered landscape and noise. It requires a relatively large area in proportion to the power production. The lower the electric power of the plant, the larger the land use per produced kWh. When the wind power plants are demolished the landscape should however be able to return to the ground- and water use before the land was claimed. Noise can be disturbing. Today, the communities generally apply a protective distance of 300-500 m.

SPINE LCI dataset: Vinyl flooring. ESA-DBP

Administrative	
Finished	Y
Date Completed	1994
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public.

Technical System	
Name	Vinyl flooring. ESA-DBP
Functional Unit	1 m2*year flooring
Functional Unit Explanation	Excerpt from the publication (see 'Publication'): ''The purpose of the study was to assess and compare the environmental impact from cradle to grave for floor coverings. The covering of one square metre of flooring during one year of operation was therefore chosen as the functional unit, or basis of comparison.'' 1 m2 of vinyl floor weighs 1.444 kg, including laying waste.
Process Type	Cradle to grave
Site	Not applicable
Sector	Construction
Owner	Not applicable
Technical system description	Excerpt from the publication: ''The life cycle of vinyl flooring. Polyvinyl chloride (PVC) is one of the main constituents of vinyl flooring. It is produced from sodium chloride (NaCl), ethylene and electric power. Ethylene originates from crude oil. The production of PVC is divided into three sub-processes: the production of chlorine, the production of vinyl chloride monomer (VCM) and the production of PVC. First, sodium chloride is electrolysed to sodium hydroxide (NaOH), chlorine (Cl,) and hydrogen (Hz). In the VCM factory, chlorine and ethylene are reacted to ethylene dichloride (EDC). VCM is then made from EDC. In the PVC factory, VCM is polymerised to PVC under high pressure. After polymerisation and drying, the PVC undergoes further processing. In the manufacturing of flooring, PVC granules are mixed with additives (plasticisers, pigments, fillers, lubricants, foaming agents, stabilisers, flame-proofing agents, etc.) under heat and pressure, and the mixture is pressed onto a backing of fibreglass fabric. The plasticiser mainly used in the product studied is dioctyl phthalate (DOP). The plasticiser is an important additive which makes the PVC permanently more plastic and stretchable. The pigment mainly used is titanium dioxide. Calcium carbonate is the main filler used in the product studied. Finally, a surface layer of polyurethane (PUR) is put on.''

	The flow chart for vinyl flooring can be found at page 248 in the publication. This system is described in: Jönsson et al, 1997, Life cycle assessment of flooring materials: case study. Building and Environment, Vol. 32, No. 3, pp. 245-255. Link to pdf: http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf Other processes in the CPM Database also included in the above publication: Linoleum flooring. ESA-DBP Solid wood flooring. ESA-DBP Other processes in the CPM Database connected to the above publication: Dioctyl phthalate (DOP) production. ESA-DBP

System Boundaries

Nature Boundary	Not applicable.
Time Boundary	Data are applicable to the situation at the time, i.e. 1994.
Geographical Boundary	The scenarios describe a Swedish situation. The vinyl studied was produced in Sweden.
Other Boundaries	Excerpts from the publication (see 'Publication'): - Floorings for domestic use were studied. - It was assumed for the calculations that there is no recycling or recovery of the flooring materials, and that all materials are incinerated, with energy recovery, after use. - It was assumed that all pigments used consisted of titanium dioxide. - Some additives in the products were used in such small quantities that their environmental impact was disregarded in the study.
Allocations	Excerpt from the publication (see 'Publication'): ''The environmental impact of multi-output processes was allocated in proportion to the physical parameter most closely reflecting the economic value, which in most cases resulted in weight being used. No allocation was made between the two functions of incineration, waste elimination and heat production. Instead, the heat produced was reported as a useful energy flow leaving the systems analysed.''
Systems Expansions	Not applicable.

About Inventory

Publication	Jönsson et al, 1997, Life cycle assessment of flooring materials: case study. Building and Environment, Vol. 32, No. 3, pp. 245-255. Link to pdf: http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf
Intended User	LCA practitioners.
General Purpose	Excerpts from the publication (see 'Publication'): ''THE consequences of the human impact on the environment have become increasingly clear in recent years. A number of previously unknown environmental problems have emerged at local, regional and global levels, in spite of considerable efforts to decrease environmental emissions from identified point sources. Consequently, demands are now being made on the environmental soundness of products. From industry there is a demand for methods of improving products from the environmental point of view, both for internal use and for marketing purposes. Authorities need methods which can be used to assess the environmental consequences of product related decisions. Life cycle assessment (LCA) is becoming an increasingly important method for making product related environmental assessments.'' ''When applying LCA to building materials and components, special methodological problems arise because of the relatively long lifetime and the complex purpose of these products. Therefore, a project entitled ''Environmental Assessment of Buildings and Building Materials'' has been initiated at the Department of Technical Environmental Planning of Chalmers University of Technology (CTH). The case study of flooring materials presented in this article constitutes the first step in this project.''
Detailed Purpose	Excerpt from the publicatoin (see 'Publication'): ''The environmental impact of three flooring materials during their life cycles was assessed and compared using the LCA method. The objective was to make a specific comparison between the environmental impacts of the life cycle of some flooring materials and to develop a methodology for LCA of building materials.''
Commissioner	Not applicable - .
Practitioner	Jönsson, Åsa - Technical Environmental Planning Chalmers University ofTechnology Göteborg Sweden .
Reviewer	Tillman, Anne-Marie - Environmental Systems Analysis
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries'.
About Data	Excerpts from the publication (see 'Publication'): '' - The three studied products all have a calorific value and could alternatively be used as fuels. Since the energy recovered from incineration was accounted for as an energy gain, the calorific value of the materials was treated as an energy cost. - Production of electricity was not included in the systems analysed, due to lack of data. Electricity use was thus accounted for only as the amount used. When interpreting the results, the amount of electricity used reflects a number of environmental impacts, including flooded land from hydropower, radioactive waste from nuclear power and emissions to the air from fossil fuel based electricity production. - The environmental impact of cleaning and maintenance was omitted. It was roughly assumed that the cleaning habits are probably independent of what floor covering is used. In addition, no reliable data were available in this area.'' ESA Database Project. Years: 2009-2011. Documentation completed for this data set: 2010-09-15 Administering organisation: Chalmers University of Technology, the division of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA). Review committee for documented data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).

Technical System	
Name	Virgin aluminium production
Functional Unit	1 kg
Functional Unit Explanation	Inventory result for production of 1 kg aluminium from ore, at Hydro Aluminium in Karmoy, Norway.
Process Type	Cradle to gate
Site	
Sector	Materials and components
Owner	
Technical system description	BRIEF DESCRIPTION: The production of aluminium includes: (1) Bauxite mining (2) Bayer processing In the bayer process aluminium oxide is produced. The production of burnt lime (see section 2a) and NaOH (see section 2b) is included. (2a) Production of explosives, limestone mining and calcination are the process steps for burnt lime. The transports between these three processes are included. Production of explosives includes production of ammonium nitrate (extraction of natural gas, production of ammonia, nitric acid and ammonium nitrate), sodium nitrate, mineral oil, glass microballoons and aluminium powder. (2b) NaOH production includes salt mining and the transport to the NaOH production plant. (3) Prebake electrolysis or Söderberg electrolysis Prebake anode, aluminium fluoride and cathodes are used in the Prebake electrolyses. Aluminium fluoride, coal tar pitch, petroleum coke and cathodes are used in the Söderberg electrolysis. (3a) Prebake anode production includes coal tar pitch production and petrolium coke production. Coal tar pitch production includes crude tar production and the transport of tar to the coal tar pitch production plant. Petroleum coke production includes crude oil extraction, coking and hydrogenation, calcination of green coke and the transport of heavy oil to the coke plant and calcination. (3b) Aluminium fluoride production includes the transport of CaF_2 and aluminium hydroxide to the aluminium production plant. (3c) Cathode production includes steel production, carbon piece production, production of insulation stone and production of fire proof stone. The transport of steel, insulation stone, fireproof stone and carbon pieces to the cathode production plant and the transport of coal tar pitch and petrolium coke to the plant where the carbon pieces are produced, are also included. (3d) Coal tar pitch production (see (3a)). (3e) Petrolium coke production (see (3a)). Electricity production is included in this study, that is, emissions as well as fuel demand. PROCESS DESCRIPTION: (1) Bauxite mining Aluminium oxide is produced from bauxite in the Bayer process. Hydro Aluminium in Karnemoy buys aluminium oxide mainly from Jamaica and Guinea but since there are no data from these sites, it is assumed that the bauxite mining and the production of aluminium oxide takes place in Australia. After mining the ore is crushed and washed to remove sand and clay. Bauxite normally has an aluminium oxide content of 50-60%, wich equals about 25-30% aluminium. (2) Bayer processing In the bayer process aluminium oxide is produced. The production of burnt lime (see section 2a) and NaOH (see section 2b) is included. (2a) The production of burnt lime includes the production of explosives, limestone mining and calcination. The transports between these three processes are included. Production of

explosives includes production of ammonium nitrate (extraction of natural gas, production of ammonia, nitric acid and ammonium nitrate), sodium nitrate, mineral oil, glass microballoons and aluminium powder.

- Production of explosives

The production of explosives includes production of ammonium nitrate (extraction of natural gas, production of ammonia, nitric acid and ammonium nitrate), sodium nitrate, mineral oil, glass microballoons and aluminium powder.

Ammonium nitrate
Dyno Nitrogen in Ljungaverk, Sweden, produces the ammonium nitrate used in the production. According to Mr Hans Mattsson, production manager at Dyno Nitrogen, ammonia is bought from Hydro Agri in Landskrona, Sweden. Hydro Agri is assumed to import ammonia from Ukraine.

The produced ammonia is transported 3400 km, by train, from Ukraine to Dyno Nitrogen in Ljungaverk, Sweden. The mode of conveyance is assumed and the distance estimated.

Production of nitric acid starts with gasification of compressed ammonia. Air is added and the mixture is heated in the purpose to oxidise the ammonia to nitrogen oxides. The process gases are cooled and led to an absorption tower. The nitrogen oxides are absorbed and they react with water to nitric acid. 19,7% of the produced nitric acid is sold, the rest is used for the ammonium nitrate production.

Ammonium nitrate is carried out by mixing a 54% solution of nitric acid with gaseous ammonia in a reactor. Ammonia nitrate is formed in an exoterm reaction. The produced ammonium nitrate is sold in liquid, crystalline or in pilled form.

The ammonium nitrate is transported on the road from Ljungaverk, Sweden, to Kiruna, Sweden. The mode of conveyance is assumed and the distance, 866 km, is estimated.

Sodium nitrate
Sodium nitrate is produced through extraction from a nitrate mineral called Caliche. Caliche is found and mined in Chile, where also the sodium nitrate is refined. The mined mineral today has a content of about 7% sodium nitrate. It is imported to Sweden via Antwerp in the Netherlands.

The sodium nitrate is transported from Chile to Gothenburg in Sweden, via Antwerp, by boat and the distance is estimated to 15400 km. Further it is transported on the road from Gothenburg to Kiruna, and the distance is estimated to 1580 km.

Mineral oil
The production of mineral oil is approximated to the production of fuel oil and includes the extraction of crude oil, transport and refinery. The mineral oil is produced by Mobil in Uddevalla, Sweden, and is transported on the road for 1540 km to Kiruna, Sweden (the distance is estimated).

Glass microballoons
Microballoons are produced by MMM in France. The microballoons are transported 3000 km, from France to Kiruna, Sweden (estimation).

Aluminium powder
Aluminium powder is imported from Germany, Italy or Switzerland, but data has been used from the production of aluminium at Hydro Aluminium in Karmoy, Norway. The aluminium powder is transported from Germany, Italy and Switzerland to Kiruna, Sweden. The transport distance for aluminium powder is a mean value of the distance from Germany, Italy and Switzerland to Kiruna, Sweden, and is estimated to 3000 km.

The transport of emulsifier is assumed to be 300 km, on the road.

The data for the production of the explosive are valid for Kimlux at Kimit AB in Kiirunavara, Sweden.

- Limestone mining
The mining takes place in Japan, but data from Swedish mining is used. The mining process is very similar throughout the world. The system includes transportations in Japan.

- Calcination
The calcination also takes place in Japan, but more recent data is used from Mineral AB in Rättvik, Sweden. The transport of limestone in Japan, from the mine to the calcination plant, is assumed to be 20 km, on the road. The burnt lime is then transported by boat from Japan to the Bayer plant in Australia. The distance is estimated to 6500 km.

(2b) NaOH production includes rocksalt mining, the transport of the rocksalt to the NaOH production plant and the diaphagm process.

Rock salt mining
It takes place in the USA. No data on emission is included in this activity. Transport to the NaOH production plant is included.

NaOH is produced in the USA by the diaphagm process. It is transported to the Bayer plant in Australia by boat and the distance is estimated to 30000 km.

(3) Prebake electrolysis or Söderberg electrolysis. Prebake anode production (see section

3a), Aluminium fluoride production (see section 3b) and Cathode production (see section 3c) are used in the Prebake electrolyses. Aluminium fluoride, coal tar pitch, petrolium coke and cathodes are used in the Söderberg electrolysis.

The aluminium production takes place at Hydro Aluminium, Norge.

The production is based on virgin aluminium oxide, bought on the open market. Aluminium oxide and prebake anode is transported from the Bayer process in Australia to Hydro Aluminium in Karmoy, Norway. The distance is estimated to 30000 km and the means of transport is boat.

The main process for producing pure aluminium is electrolyses, where the aluminium oxide is reduced to liquid aluminium in a sequence of electrolysis baths. At Karmoy, two processes are used; the older Söderberg and the more modern prebake process. The anode paste for the Söderberg process is produced at Karmoy. Half of the yearly production comes from the Söderberg process and the other half is from the prebake process.

Raw materials for the electrolyses are aluminium oxide, carbon anodes, aluminium fluoride and cathode materials. The electrolysis bath consists of cryolite ($AlF_3 \cdot 3NaF$), that is formed in the reaction between sodium oxide (Na_2O) and aluminium fluoride (AlF_3).

(3a) Prebake anode production includes coal tar pitch production and petrolium coke production. Coal tar pitch production includes crude tar production and the transport of tar to the coal tar pitch production plant. Petroleum coke production includes crude oil extraction, coking and hydrogenation, calcination of green coke and the transport of heavy oil to the coke plant and calcination.

The anode for the Prebake-process is produced in Rotterdam by Aluchemie and imported to Norway. The transport distance of coal tar pitch and petroleum coke has been assumed to 300 km and the mode of conveyance to be road.

Coal tar pitch production

Coal tar pitch production includes crude tar production and the transport of tar to the coal tar pitch production plant.

Suppliers of coal tar pitch to Karmoy in Norway are three different companies in Denmark, Germany and Great Britain. In this study site-specific data from Tarconord A/S in Nyborg, Denmark has been used. The production is made in three steps; one dewatering step and two extraction steps.

Crude tar
Coal tar pitch is made from crude tar, a by-product from the coke production. The crude tar used at Tarconord A/S is mainly bought from steel works around the world. Data from SSAB Tunnplåt in Luleå, Sweden is used. Crude tar is transported from steel works around the world to Tarconord A/S in Nyborg, Denmark. The transport distance is estimated to 990 km by Per Bech, the environmental manager at Tarcord.

Petrolium coke production

Petrolium coke production includes crude oil extraction, coking and hydrogenation, calcination of green coke and the transport of heavy oil to the coke plant and calcination.

Petroleum coke is produced from heavy oil fraction from refineries by the Söderberg process, at Karmoy, Norway. The petroleum coke is mainly bought from Statoil in Mongstad, Norway but is also imported from Great Britain, Germany and the USA.

Crude oil extraction
Statoil in Mongstad uses crude oil extracted in the North Sea in their production. In this study energy use and emission for crude oil refining to heavy oil are included. The heavy oil is transported from the refineries to Statoil in Mongstad, Norway. The distance is assumed to be 1000 km.

Coking and hydrogenation
The heavy oil is coked and hydrogenated in a multi output process. In this processes five products are produced. The products have the following weight percentages of the total production in the two processes:
- gas 11%
-nafta 11%
-light gas oil 50%
-heavy gas oil 11%
-green coke 17%.

Calcination of green coke
The heaviest fraction in the petroleum coke production, the green coke, is further calcinated and becomes petroleum coke.

(3b) Aluminium fluoride production includes the transport of CaF_2 and aluminium hydroxide to the aluminium production plant.

CaF_2 mining
CaF_2 is mined in Morocco, China and Mexico. The CaF_2 is transported from Morocco to the aluminium fluoride producer by boat (assumption). Further it is assumed that the production of aluminium takes place in northern Europe, wich gives a distance of 4000 km.

	Aluminium hydroxide The aluminium hydroxide is transported to aluminium fluoride producers, a distance assumed to be 1500 km, by boat. The production, called the dry process, is performed in three steps. First, aluminium hydroxide (Al(OH)2) is heated and activated to aluminium oxide(Al2O3). The first reaction is between calcium fluoride and (CaF2) and sulphuric acid (H2(SO)4). Formed products are fluohydric acid (HF) and anhydrite gypsum (Ca(SO)4) as a by-product. Oil is assumed to be used for heating. In the third step fluohydric acid reacts with aluminium oxide (Al2(O3)) and forms aluminium fluoride (AlF3), water and heat. (3c) Cathode production includes steel production, carbon piece production, production of insulation stone and production of fire proof stone. The transport of steel, insulation stone, fireproof stone and carbon pieces to the cathode production plant and the transport of coal tar pitch and petroleum coke to the plant where the carbon pieces are produced, are also included. Steel production Data is taken from SSAB Tunnplåt in Luleå, Sweden. The steel is assumed to be transported on the road from SSAB Tunnplåt in Luleå, Sweden to Hydro Aluminium in Karmoy, Norway and the distance is estimated to 1600 km. Carbon piece The transport of coal tar pitch from unknown supplier to the carbon piece producer is assumed to be done on the road, about 300 km. The same is assumed for petroleum coke. Hydro Aluminium buys their carbon pieces from Germany, France or Japan. The carbon pieces are transported from Germany, France and Japan to Hydro Aluminium in Karmoy, Norway. A mean value of the three distances (one third from each producer) is 1000 km. The mode of conveyance is assumed to be boat. Production of insulation stone Insulation stone is produced in Denmark or Italy. The insulation stone is transported from Denmark and Italy to Hydro Aluminium in Karmoy, Norway. A mean value gives 400 km by boat and 900 km by road. Production of fire proof stone Fired proof stone is produced in Norway, Scotland and two places in Germany. The transport distance for fire proof stone, from Norway, Scotland and the two places in Germany to Hydro Aluminium in Karmoy, Norway, is a mean value of the four distances. The mode of conveyance is assumed to be boat (650 km) from Germany and Scotland and road by (75 km) within Norway.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: This study includes environmental loadings such as material resources, resources for energy production, waste and emissions to air and water. Cradle = Mine.
Time Boundary	APPLICABLE TIME OF SYSTEM/PRODUCT: This set of data is more recent than earlier studies when it comes to several of the processes. Bauxite mining and aluminium oxide production are the exceptions, where old data has been used.
Geographical Boundary	GEOGRAPHICAL EXTENSION The data represent production sites in Norway.
Other Boundaries	NOTES OF EXCLUDED TECHNICAL SYSTEMS: Production of capital goods, transport of labour and so called overhead processes are not included in this study. The following parameters are not traced back to the cradle: H2SO4, insulation stone, fire proof stone, emulsifier. Insulation stone Insulation stone is produced in Denmark or Italy, but the production process is not included in this study. Fire proof stone Fired proof stone is produced in Norway, Scotland and two places in Germany, but the production process is not included in this study. Cathode production The cathode production takes place at Hydro Aluminium in Karmoy, Norway. No data on environmental loadings are known and therefore it is not included in this study.

Allocations	PRINCIPLE APPLIED: DESCRIPTION: Crude tar production An allocation on mass basis is made. 2,87% of the environmental load is allocated to tar production. Production of coal tar pitch The production of coal tar pitch during a year is 45% by weight of the total production at Tarconord. An allocation is made on mass basis by Per Bech, environmental manager at Tarconord. Production of aluminium fluoride All environmental loads are allocated to aluminium fluoride. Most of the anhydrite gypsum is used as landfill. Production of ammonium nitrate For the production of ammonium nitrate, the raw materials nitric acid and gaseous ammonia are used. The energy used in the production is divided between the products by an allocation on mass bases.
Systems Expansions	No.

Flow Data

About Inventory

Publication	Life Cycle Assessment of Aluminium, Copper and Steel, Maria Sunér, Technical Environmental Planning, Report 1996:6 , Chalmers University of Technology, Gotherburg, Sweden -- Data documented by: Maria Erixon, project employed at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology --
Intended User	Anyone who wants to make an Li
General Purpose	To make a life cycle assessment of aluminium, copper and steel.
Detailed Purpose	The data is presented in the report Life Cycle Assessment of Aluminium, Copper and Steel. The purpose of the report was to collect and present inventory data on production and recycling of the three materials aluminium, copper and steel of higher quality than earlier published data.

Practitioner	Sunér, Maria - Teknisk Miljöplanering Chalmers Tekniska Högskola 412 96 Göteborg Sweden.

Reviewer	
Applicability	CERTAIN CAUTIONS: Almost all data is site-specific and therefore it is not directly applicable in LCA:s requiring average data for metal production.
About Data	GENERAL DATA SOURCE DESCRIPTION: The data represent production sites in Norway. This set of data is a mixture of litterature data and site specific data. -- Production of explosives About 1,4% of the produced Kimlux is packed into plastic pipes and sold as Kimlux 42/82 and the rest is sold in tanks as Kimlux R. In this study all production is assumed to be Kimlux R. Mineral oil The production of mineral oil is approximated to the production of fuel oil. Glass microballs Literature data has been used for production of glass from virgin raw materials, from Packaging and the environment, Tillman A-M et al., Chalmers Industriteknik, Göteborg; Sweden (1992). Petroleum coke production In this study, data from Statoil in Mongstad is used. As Statoil in Mongstad does not produce enough of heavy oil in their refinery, the main part is bought from other refineries. Crude oil extraction It is assumed that the refining of crude oil to heavy oil only consumes 10% of the energy used for gasoline refining. Production of coal tar pitch The production of coal tar pitch during a year is 45% by weight of the total production at Tarconord. Anode production for Prebake The data used for this process is literature data. Aluchemies suppliers is not known. The Prebake anode consists of 85% petrolium coke and 15% coal tar pitch. Aluminium fluoride production Raw materials for aluminium fluoride production are CaF_2, $Al(OH)_3$ and H_2SO_4. Hydro Aluminiums main supplier is not known. Data used in this study is a common known average from several aluminium fluoride suppliers. CaF_2 mining The environmental load for CaF_2 mining has been approximated with the environmental load for limestone mining. Production of $H_2(SO)_4$ $H_2(SO)_4$ is often a by-product from other productions and is therefore treated as an inflow not traced back to the cradle. The transport is excluded. Carbon piece production As no data for this production are available, data for anode production is assumed to be valid. It is also assumed that the raw material distribution are 50% coal tar pitch and 50% petrolium coke. Production of insulation stone As no data are available the insulation stone is an inflow not traced back to the cradle. It is assumed that half of Hydro Aluminium's need is purcased from each producer. Production of fire proof stone As no data are available, fire proof stone is considered to be an inflow not traced back to the cradle. It is assumed that one fourth of Hydro Aluminium's need is purcased from each producer. Cathode production The cathode production takes place at Hydro Aluminium in Karmoy, Norway. No data on environmental loadings are known and therefore it is not included in this study. Aluminium production The main source of the data is Per Ravn, Environmental and security manager at Hydro Aluminium in Karmoy, Norway. The production is based on virgin aluminium oxide, bought on the open market. There are many suppliers. Hydro Aluminium owns parts of an aluminium oxide plants on Jamaica and Guine wich cover 40% of their need.

	The prebake process has prebakes anodes and generates less emissions, especially CF4, than the Söderberg process. It is also a process with with more automation and less heat losses. The sodium oxide is found as an impurity (0,5%) in the aluminium oxide. In average 11% AlF3 is added to th electrolysis bath. Emissions of fluorine and fluorides originates mainly from the electrolysis. The fluorides consist of HF, particulate fluorides and some CF-gases (95% CF4 and 5% C2F6). The anode is booked as a resource at the extraction of the needed raw materials and not as an internal energy carrier. However the anode contributes with energy to the process. The casting of ingots is included in this activity.

Technical System	
Name	Virgin steel production
Functional Unit	kg
Functional Unit Explanation	Inventory result for production of 1 kg virgin steel.
Process Type	Cradle to gate
Site	
Sector	Materials and components
Owner	
Technical system description	The steel production is situated at SSAB Tunnplåt in Luleå, Sweden. Mainly virgin raw material is used, in the form of iron ore pellets, distributed at LKAB in Malmberget, Sweden. The production of explosives (Kimulux R), used in limestone mining for steelproduction, at Kimit AB is also included. -- (1) Iron ore pellet production at LKAB Explosives is transported to the Olivine and Iron ore mining. The production of explosives is included, see section (3) below. The iron goes through the processes of Dressing, Concentration, Pelletising to finally become iron pellets. The olivine is transported from the olivine mining to the concentration process. Bentonite is transported from the bentonite mining to pelletising process. (2) Steel production at SSAB Tunnplåt In the main process steps the iron pellets from LKAB are transported to the Blast furnace, where limestone and coal are added, and then goes through the processes at the Steel work. Explosives are transported to the Limestone mining (at Nordkalk Storugns on the island of Gotland in Sweden), and the mined limestone further partly to the Blast furnace and partly to the Limestone oven. From the Limestone oven the lime is added in the Steel work, together with Aluminium and Alloy materials. Coal, from the Coal mining, is transported partly straight to the Blast furnace and partly via the Coke plant.

	(3) Production of explosives (Kimulux R) at Kimit AB The raw materials Sodium nitrate (3.1), Ammonium nitrate (3.2), (together 85% of the raw materials), Mineral oil (3.3), Microballoons (3.4), Emulsifier (3.5) and Aluminium powder (3.6) are transported to the Explosives production plant at Kimit AB in Kiirunavara in Sweden, wher Kimulux R is produced. (3.1) Sodium nitrate production Sodium nitrate is produced through extraction from a nitrate mineral called chalice. Chalice is find and mined in Chile, were also the sodium nitrate is refined. The sodium nitrate contents in the mined mineral is about 7%. The produced sodium nitrate is imported to Sweden via Antwerp in the Netherlands. It is transported by boat 15 400 km, from Chile to Gothenburg via Antwerp and by road 1580 km, from Gothenburg to Kiruna. (3.2) Ammonium nitrate production For the production of ammonium nitrate, nitric acid and gaseous ammonia are used. The production takes place at Dyno Nitrogen in Ljungaverk, Sweden, and it includes the Extraction of natural gas, Transport to the Ammonia production and further Transport partly straight to the Ammonium nitrate production and partly via NHO3-production. The production of nitric acid starts with gasification of compressed ammonia. Air is added and the mixture is heated in purpose to oxidise the ammonia to nitrogen oxides. The process gases are cooled and led to an absorption tower. The nitrogen oxides are absorbed and reacts with water to nitric acid. 19,7% of the produced nitric acid is sold, the rest is used for the ammonium nitrate production. The ammonia is bought from Hydro Agri in Landskrona, Sweden. Hydro Agri imports ammonia from Ukraine. The transport of ammonia from Ukraine to Dyno Nitrogen in Ljungaverk, Sweden, with a stop at Hydro Agri in Landskrona, Sweden, is assumed to be done by train. The distance is estimated to 3400 km. Ammonium nitrate production is carried out by mixing a 54% solution of nitric acid with gaseous ammonia in a reactor. Ammonium nitrate is formed in an exothermic reaction. The product is sold in liquid, crystalline or in pilled form. The ammonium nitrate is transported 866 km (estimated) by road, from Ljungaverk to the explosives production plant in Kiirunavara, Sweden. (3.3) Mineral oil production The production of mineral oil is approximated to the production of fuel oil and includes the Extraction of crude oil, Transport and Refinery. The mineral oil is produced by Mobil in Uddevalla, Sweden, and is transported 1540 km (estimated) by road to Kiruna, Sweden. (3.4) Microballoon production The microballoons are produced by MMM in France. They are transported 3000 km (estimated) by road to Kiruna, Sweden. (3.5) Emulsifier The production of emulsifier is excluded. The transport of emulsifier is included and assumed to be 300 km, by road. (3.6) Aluminium powder production Aluminium powder is imported from Germany, Italy or Switzerland, but data has been used from the production of aluminium at Hydro Aluminium in Karmoy, Norway. The transport distance for aluminium powder is a mean value of the distance from Germany, Italy and Switzerland to Kiruna, Sweden, and is estimated to 3000 km. Electricity production is included.

System Boundaries	
Nature Boundary	Emissions to air and water, waste and natural resources.
Time Boundary	The data is collected during the early nineties and one should consider some change i process steps etc. as times go.
Geographical Boundary	Most of the processes takes place in Sweden, except for the production of microballoons wich takes place in France. The chalice is mined in Chile, the aluminium powder is imported from Germany, Italy or Switzerland and the ammonia from Ukraine.
Other Boundaries	The production of emulsifier is excluded from this study and it is a minor inflow. The emulsifier is treated as an inflow not traced back to the cradle.

Allocations	All environmental impact is allocated to the steel production (at SSAB Tunnplåt in Luleå, Sweden). - Production of explosives (Kimulux R) at Kimit AB 92,8% (by weight) of the total production at Kimit AB 1994 was Kimulux R. This allocation factor is used for the environmental loadings.
Systems Expansions	No.

Applicability	

About Data	- Production of explosives (Kimulux R) at Kimit AB Ammonium nitrate production Data for the extraction of natural gas is valid for the North Sea, but it is also assumed to be valid for Ukraine. The data is litterature data. All oil is assumed to be used in the production of nitric acid. All electricity used in the ammonium nitrate production is assumed to be used in the process of mixing nitric acid with ammonia and all emissions that are not from any specific process are accounted for here. The oil accounted for is the resource for the used transformer oil. Glass microballoon production Since no data were available, literature data has been used for the production of glass.

Technical System	
Name	Wood chips fired plant (with stoker) for heat and power production - Large plant
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of resources and raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in a wood chips fired plant with stoker for heat and power production located in Sweden. The heat is delivered to a district heating net. Production of materials, chemicals and electricity, transport, used in association with the fuel chain and the operation and maintenance of the plant are not included. TECHNICAL DATA FOR THE STUDIED PLANT: Average annual time of use (hours): 5 598 Total electric output (MW): Not known. Only given as the total of three boilers. Total thermal output (MW): 78+13 Annual total fuel use (MWh): 319 031 Normal annual production of heat (MWh): 297 406 Normal annual production of electricity (MWh): 30 195 Degree of thermal efficiency (%): 102,7 PROCESS DESCRIPTION: The plant consists of a steam boiler unit of 80 MW thermal output with a flue gas condensing system of 13 MW thermal output. Electricity is produced in three turbines that are common for three boilers. The solid fuel is combusted on a grate. The grate can be moving or sloping. The fuel is fed to one end of the grate and during the combustion transported to the other side. At the end of the grate the ashes is taken out. Air is added both through the bed and as over-fire air

	higher up in the combustion chamber to complete the combustion. The dust is removed from the flue gas in an electrostatic precipitator. INCLUDED OPERATIONS: The process of study consists of the following operations: - The feeding of the pulverized wood into the combustion process. - The combustion process. - The removal of dust from the flue gas in the electrostatic precipitator. - The internal treatment of the residues from the combustion process. - The internal consumption of electricity. - The internal consumption of chemicals used in the flue gas system and in the feed water treatment. - The NOx control system. NOx CONTROL: The boiler is equiped with a SNCR process for lower NOx emissions. Urea is used as reducing agent. SNCR (Selective Noncatalytic Reduction) describes a method for reducing the NOx already formed during the combustion process. In the process, an aqueous reduction agent mixed in water or steam is injected into the furnace during the combustion process. The reduction agent reduces the NOx and forms nitrogen and water. OTHER FLUE GAS CLEANING SYSTEMS: - For the removal of dust from the flue gas an electrostatic precipitator is used. In an electrostatic precipitator the dust particles are electrified and then separated from the flue gas stream by passing through an electric field with largest possible intensity. - Due to the low sulphur content in wood fules, no reduction of the sulphur content in the flue gas is needed.

System Boundaries	
Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are normally measured and reported once yearly in a public environmental report. The emission of HC is not measured.
Time Boundary	APPLICABLE TIME OF SYSTEM: This inventory was conducted using data mainly from 1996. The data consists of average data on a year basis. This data is assumed to be valid until new national or local regulations are enforced in Sweden.
Geographical Boundary	GEOGRAPHICAL EXTENSION This inventory has been conducted on a wood chips fired plant with stoker for heat and power production in Sweden, with swedish regulations, applicable during 1996. The collected data should be used for swedish conditions.
Other Boundaries	NOTES OF EXCLUDED TECHNICAL SYSTEMS: The following operations have been excluded from the system: - The distribution of district heat from the plant to the consumers. - Buildning of the plant and the district heating net. - The cradle to gate of the internal electricity consumption. - The production of the pulverized wood fuel. - The transportation of the fuel to the plant. - The transportation of the residues from the combustion and cleaning processes to the landfill or back to the forest. - The process at the landfill such as leaching, decomposition etc. - The spreading of the ashes in the forest. EXCLUDED FLOWS - The water consumption in the process.
Allocations	PRINCIPLE APPLIED: In a combined power and heating plant two products of economic value are produced, heat and electrical power. For operation and maintenance of the plant the use of resources and the emissions are associated in relation to the net production of heat and power respectively. For the use of resources and the emissions that are specific for the electrical power production are allocated to that production. Equivalent to this the use of resources and the emissions specific for the heat production are allocated to this production. Note: When both heat and power are produced the allocation between the products are the same. That is the environmental load for 1 kWh produced heat are the same as for 1 kWh produced electrical power. DESCRIPTION:
Systems Expansions	N/A

Flow Data	
General Activity QMetaData	
Date Conceived	1996

Data Type	
Represents	See 'Function'.
Method	All data reported is related to the functional unit 1 kWh heat produced and delivered. The data is originally given as the total yearly amount of an input (fuel, chemical, electricity etc.) to or an output (emission, product etc.) from the energy plant. The inputs and outputs are the related to the functional unit by dividing the total yearly amount with the yearly amount of produced heat and multiplying with the fraction of the total production that are associated with the heat production. For some flows specific information is given, see each flow.
Literature Reference	Data are in general recieved from ''Miljörapport 1996, Tekniska Verken i Linköping''.
Notes	The parameters presented are chosen because they are available in the annual environmental report of the plant. Data can be missing if it is not reported in the report. The type of data reported is governed by the inspection authority. All data are reported with 3 figures. The data are however seldom that accurate.

Technical System	
Name	Wood fired CFB plant for heat production - Small plant
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of recources and raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in a wood chips fired CFB (Circulating Fluidised Bed) plant for heat production. The plant is located in Sweden and is fired with wood chips. The heat is delivered to a district heating net. Production of materials, chemicals, electricity and transport, used in association with the fuel chain and the operation and maintenance of the plant are not included. TECHNICAL DATA FOR THE STUDIED PLANT: Average annual time of use (hours): 4 071 Total thermal output (MW): 10 Annual total fuel use (MWh): 40 931 Normal annual production of heat (MWh): 36 463

	Degree of thermal efficiency (%): 86,9 PROCESS DESCRIPTION: The plant consists of one unit of 10 MW maximum thermal output. The dust is removed in a cyclone and a textile filter. INCLUDED OPERATIONS: The process of study consists of the following operations: - The feeding of the wood into the combustion process. - The combustion process. - The removal of dust from the flue gas in the cyclone and the textile filter. - The internal treatment of the residues from the combustion process. - The internal comsumption of electricity. NOx CONTROL: The boiler is not equiped with any NOx control system. The CFB, circulating fluidised bed combustion, is in itself a low NOx technique. OTHER FLUE GAS CLEANING SYSTEMS: - For the removal of dust from the flue gas a cyclone and a textile filter are used. The combustion gases with the particles are entering the cyclone at a high speed. In the cyclone the particles are separated from the gas stream by centrifugal acceleration forces. - Due to the low sulphur content in wood fules, no reduction of the sulphur content in the flue gas is needed.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are normally measured and reported once yearly in a public report.
Time Boundary	APPLICABLE TIME OF SYSTEM): This inventory was conducted using data mainly from 1996. The data consists of average data on a year basis. This data is assumed to be valid until new national or local regulations are enforced in Sweden.

Flow Data

General Activity QMetaData

Date Conceived	1996
Data Type	
Represents	See 'Function'.
Method	All data reported is related to the functional unit 1 kWh heat produced and delivered. The data is originally given as the total yearly amount of an input (fuel, chemical, electricity etc.) to or an output (emission, product etc.) from the energy plant. The inputs and outputs are then related to the functional unit by dividing the total yearly amount with the yearly amount of produced heat. For some flows specific information is given, see each flow.
Literature Reference	The data is in general recieved from ''Miljörapport 1996, AB Eksjö Energi''.

Notes	The parameters presented are chosen because they are available in the annual environmental report of the plant. Data can be missing if it is not reported in the report. The type of data reported is governed by the inspection authority. All values are reported with 3 figures. The data are however seldom that accurate.

About Inventory

Publication	LCA värme, Vattenfalls Livscykelanalyser, Produktion av värme; Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius; SwedPower AB, Miljö & Kvalitet; 1999-07-01. --- Data documented by: Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders at SwedPower AB Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology ---
Intended User	Intended user of the data are
General Purpose	The general purpose of the inventory was to obtain a lifecycle inventory of heat producing plants using different types of fuels. A further purpose was to obtain data from heat producing plants with different capacities.
Detailed Purpose	The specific purpose is to compare data from plants producing heat, with various fuels, combustion technologies and flue gas cleaning systems.
Commissioner	Bodlund, Birgit - Vattenfall AB.
Practitioner	- SwedPower AB, Maria Münter, Emanuel Nandorf, Pernilla Strömberg, Andrea Wallenius, Birgitta Olanders .
Reviewer	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
Applicability	CERTAIN CAUTIONS: This inventory was conducted using data mainly from 1996. The data consists of average data on a year basis. This data is assumed to be valid until new national or local regulations are enforced in Sweden. This data should only be used on plants producing heat in Sweden and for swedish conditions.

About Data	GENERAL DATA SOURCE DESCRIPTION: Data quality in the meaning good precision for the operation of the plant concerning for example the precision of emission measurements, calibration of instruments are good for plants larger than 10 MW and/or plants with a production larger than 25 GWh/year. These plants are included in the NOx control system . At these plants the instruments for NOx-control and calculations are controlled every year at the periodical inspection. Most larger plants are also calibrating other instruments in there own interest or as a consequence of an internal control program.

Availability	Public

Technical System	
Name	Wood pellets fired plant for heat and power production - Large plant
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of resources and raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in a wood pellets fired plant for heat and power production. The plant is located in Sweden and is fired with wood pellets. The heat is delivered to a district heating net. Production of materials, chemicals, electricity and transport used in association with the fuel chain and the operation and maintenance of the plant are not included. TECHNICAL DATA FOR THE STUDIED PLANT: Average annual time of use (hours): 4 826 Total electric output: Not known Total thermal output (MW): 6,8 Annual total fuel use (MWh): 48 611 Normal annual production of heat (MWh): 42 143 Normal annual production of electricity (MWh): 9329 Degree of thermal efficiency (%): 92,0 PROCESS DESCRIPTION: The plant consists of two steam boiler units of 6,8 MW thermal output each. The boilers are of MBC type (Multi Bed Combustion). Dust is removed from the flue gas in a dust filter bag. INCLUDED OPERATIONS: The process of study consists of the following operations: - The feeding of the wood pellets into the combustion process. - The combustion process. - The removal of dust from the flue gas in the electrostatic precipitator. - The internal treatment of the residues from the combustion process. - The internal consumption of electricity. NOx CONTROL: The boilers are not equiped with any NOx control system. The MBC, (Multi Bed Combustion), technique is in itself a low NOx technique.

	OTHER FLUE GAS CLEANING SYSTEMS: - For the removal of dust from the flue gas an electrostatic precipitator is used. Electrostatic precipitation In an electrostatic precipitator the dust particles are electrified and then separated from the flue gas stream by passing through an electric field with largest possible intensity. - Due to the low sulphur content in wood fuels, no reduction of the sulphur content in the flue gas is needed.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are normally measured and reported once yearly in a public environmental report. The emission of HC is not measured.
Time Boundary	APPLICABLE TIME OF SYSTEM/PRODUCT: This inventory was conducted using data mainly from 1996. The data consists of average data on a year basis. This data is assumed to be valid until new national or local regulations are enforced in Sweden.
Geographical Boundary	GEOGRAPHICAL EXTENSION: This inventory has been conducted on a wood pellets plant fired system for heat and power production in Sweden, with swedish regulations, applicable during 1996. The collected data should be used for swedish conditions.
Other Boundaries	NOTES OF EXCLUDED TECHNICAL SYSTEMS: The following operations have been excluded from the system: - The distribution of district heat from the plant to the consumers. - Building of the plant and the district heating net. - The cradle to gate of the internal electricity consumption. - The production of the wood pellets fuel. - The transportation of the fuel to the plant. - The transportation of the residue drom the combustion and cleaning processes to the landfill or back to the forest. - The processes at the landfill such as leaching, decomposition etc. - The spreading of the ashes in the forest. EXCLUDED FLOWS - The water consumption in the process.
Allocations	PRINCIPLE APPLIED: In a combined power and heating plant two products of ecomnimic value are produced, heat and power. For operation and maintenance of the plant the use of resources and the emissions are associated in relation to the net production of heat and power respectively. For the use of resources and the emisssions that are specific for the electrical power production are allocated to that production. Equivalent to this the use or resources and the emissions specific for the heat production are allocated to that production. Note: When both heat and power are produced the allocation between the products are the same. That is the environmental load for 1 kWh produced heat are the same as for 1 kWh produced electrical power. DESCRIPTION:

Technical System	
Name	Wood pellets fired plant for heat production - Small plant
Functional Unit	1 kWh produced and delivered heat.
Functional Unit Explanation	The emissions and use of raw materials are associated with the net production of 1 kWh heat.
Process Type	Gate to gate
Site	Sweden
Sector	Grid electricity and district heat
Owner	Sweden
Technical system description	BRIEF DESCRIPTION: This technical system describes the incineration process in wood pellets fired plant for heat produciton. The plant is located in Sweden. The heat is delivered to a district heating net. Production of materials, chemicals, electricity and transport used in association with the fuel chain and the operation and maintenance of the plant are not included. TECHNICAL DATA FOR THE STUDIED PLANT: The technical data for this system is reported from the periodaical investigation of the plant. Total thermal output (MW): 1,58 Fuel use during the periodical investigation (MWh): 1,48 Production of heat during the periodical investigation (MWh): 1,58 Degree of thermal efficiency (%): 93,8 PROCESS DESCRIPTION: The plant consists of one boiler unit for the insineration of wood pellets. The thermal output is 1,58 MW. The dust is removed from the flue gas in a cyclone. INCLUDED OPERATIONS: The process studied consists of the following operations: - The feeding of the wood pellets into the combustion process. - The combustion process. - The removal of dust from the flue gas in the cyclone. - The internal consumption of electricity. NOx CONTROL: The boiler is not equiped with any NOx control system. OTHER FLUE GAS CLEANING SYSTEMS: - For the removal of dust from the flue gas a cyclone is used. The combustion gases with the particles are entering the cyclone at a high speed. In the cyclone the particles are separated from the gas stream by centrifugal acceleration forces. - Due to the low sulphur content in wood fuels, no reduction of the sulphur content in the

	flue gas is needed.

System Boundaries

Nature Boundary	CRITERIAS USED FOR SELECTING FLOWS: Most data for reported in- and outflows are taken from the final inspection of the plant. The emission of HC is not measured.
Time Boundary	APPLICABLE TIME OF SYSTEM: This inventory was conducted using data mainly from 1996. The data consists of data from the periodical inspection.
Geographical Boundary	GEOGRAPHICAL EXTENSION This inventory has been conducted on a plant fired with wood pellets for heat production in Sweden, with swedish regulations, applicable during 1996. The collected data should be used for swedish conditions.

Notes	

SPINE LCI dataset: Wool/polyamide covering of sofa. ESA-DBP

Administrative	
Finished	Y
Date Completed	2004
Copyright	Environmental Systems Analysis, Chalmers Univ. of Technology
Availability	Public

Technical System

Name	Wool/polyamide covering of sofa. ESA-DBP
Functional Unit	''The functional unit was: surface covering of a 3-seat sofa for private use during 10 years.'' For wool/PA fabric it is 5.27 kg per sofa.
Functional Unit Explanation	See 'Function'.
Process Type	Cradle to grave
Site	Not applicable
Sector	Consumer goods
Owner	Not applicable
Technical system description	The system is descibed in ''Dahllöf L, 2004, Methodological issues in the LCA procedure for the textile sector - a case study concerning fabrics for a sofa. Environmental Systems Analysis report 2004:7, Chalmers University of Technology, Gothenburg, Sweden'': http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2004--7.pdf Other processes in the CPM Database also included in the above publication: 'Cotton (conventional) fibres production. ESA-DBP', 'Cotton covering of sofa. ESA-DBP' and 'Flame retardant polyester (Trevira CS) covering of sofa. ESA-DBP'. ''The function was to provide a surface covering for a sofa. The fiber type in this LCA was conventional cotton. The color of the fabric was red. Six dry cleaning sessions for the Woll/PA fabric was assumed in order to see the relative environmental importance of the cleaning step. It was assumed that the fabric could be readily removed from the sofa. Incineration at disposal of the fabric used was assumed in the base case (the most probable life cycle chains). Heat recovery and emissions from the incineration were taken into account, but possible oil saving or replacement of other waste in the incinerator was only tested in the sensitivity analysis.'' ''Fabric for sofas with wool are usually mixed with a synthetic material, often with polyamide (PA, nylon). The weaving mills investigated used PA 66 in different amounts, from 9% to 15%. Here it was assumed that 15% of the fabric is PA 66. The wool is usually spun with a worsted system, and wool from New Zealand is popular for this application. The fiber diameter varies between 25 and 32 micrometer according to 2 of the weaving mills. In figure 4, in the ESA report 2004-7, the different companies and their roles in the production of wool/PA fiber are shown. ''The raw wool contains wool, grease, suint (sweat residues), dirt, vegetable matter and agrochemicals. In the wool scouring and combing process, the raw wool is cleaned and combed in order to get wool tops for the spinning of yarn (Ellebäk Laursen et al, 1997). The most common type of scouring takes place in water.'' In the litterature reference following processes are included: - Sheep farming in New Zealand - Shearing, removal of oddments - Truck from shearing to classing and selling of wool - Classing, baling and selling of raw wool - Freighter from New Zealand to Bremen (Germany) - Wool scouring, combing, shrink proofing, effluent treatment at Bremer Woll-Kämmerei AG (BWK) - Truck from scouring plant to spinning plant - Production of polyamide 66 (nylon) - Truck from polyamide plant to spinning mill - Spinning of wool yarn - Truck and boat from spinning mill to Swedish weaving mill - Weaving without sizing in Sweden - Business trips from wool/PA weaving mills site - Truck from weaving mill to wet treatment plant - Dyeing of wool fabric including pretreatment, rinsing and drying - Truck from Swedish wet treatment plant back to weaving mill - Textile distribution at weaving mill site in Sweden - Truck from Swedish weaving mill to upholstery plant - Upholstering of wool/PA fabric on a 3-seat sofa - Dry-cleaning - Truck from user to incineration plant - Incineration of wool/PA fabric

System Boundaries

Nature Boundary	''Mineral resources and water were traced back to their reserves in nature and emissions were followed to air, water or soil. Below are the exceptions found, when the processes were not traced back to the nature reserves or water, or followed to air, water or ground. - A wastewater-treatment plant was included, but the decomposition of each individual chemical was not studied. - The production of the process chemicals and some packaging materials were not within

	the system boundaries.''
Time Boundary	''Data were collected by interviews from 1999 to 2002, but data from reports ranged from 1993 to 1998. Most reports were from 1997.''
Geographical Boundary	''Wool/PA: *production of raw wool: New Zealand *wool scouring, spinning of wool yarn: Germany *PA production: Europe *weaving, wet treatment including dyeing of the fabric, upholstering, use and incineration: Sweden''
Other Boundaries	''The fabrics were assumed to not to be worn out before they were disposed of, a realistic scenario for Swedish conditions. Therefore the abrasion resistance was not taken into consideration in the study, while the effect of different lifetimes of the fabrics is discussed in chapter 4.3.7.'' ''Truck from shearing to classing and selling of wool The distance was assumed to 300 km.'' ''Classing, baling and selling of raw wool Energy use was not known for classing, baling and selling of raw wool. It was considered insignificant and was assumed to zero.'' ''Freighter from New Zealand to Bremen (Germany) The distance was estimated to be 24,753 km. The assumption was made that the freighter goes north of Australia and through the Suez Canal. The data represents transportation by a large freighter.'' ''Wool scouring, combing, shrink proofing, effluent treatment at Bremer Woll-Kämmerei AG (BWK) - Grease was assumed to replace mineral oil, here approximated to be heavy fuel oil. - Input of energy: Calculations were made on the basis of energy demand for the plant and recognizing that 90% of the energy is for wool. Data are for total energy use including everything in the plant. The total energy use is 23 MJ/kg raw wool. DWI (1997) states that totally 31.30MJ/kg raw wool is used for wool scouring and combing (scouring only: 5.79 MJ). The data above indicate less energy use than in the DWI statement, but energy from incineration of material in the effluent is used at BWK, which could explain the difference. - At BWK, ammonia and soda are recovered. About 50% of the wool wax (grease) is deodorized and sold. Energy from incineration of material in the effluent is used. 90% of the electricity and all heat (steam) are generated in their own plant using coal. - Inputs of chemicals: It was assumed that only wool needs these chemicals. (80% of the fibers treated are wool, the only fiber that needs scouring at BWK). The rest need only combing. Water consumption reported in the BWK brochure is assumed to be only for wool scouring. - Waste: BWK reported total amounts. The following assumptions were made: from wool only (the rest comes from all fibers proportionally): sludge, sand, wool dust, raw wool packaging, fabric. If more than 50% of the waste is recycled it is reported as Non-Elementary to the Technosphere in LCAiT. If more than 49% of the waste is not recycled it is reported as Elementary waste to ground.'' ''Truck from scouring plant to spinning plant The distance from Bremen to the spinning mill was assumed to 60 km.'' ''Truck from polyamid plant to spinning mill The distance was assumed to 100 km.'' ''Spinning of wool yarn Paraffins are only sometimes used. Here they were assumed as not used.'' ''Truck and boat from spinning mill to Swedish weaving mill The distance with a large freighter was assumed to 40 km. The distance by truck was assumed to 857 km.'' ''Business trips from wool/PA weaving mills site The travel distance was calculated to 0.63 vkm/kg fabric.'' ''Truck from weaving mill to wet treatment plant The distance was assumed to 30 km.'' ''Dyeing of wool fabric including pretreatment, rinsing and drying - The drying step also includes fixation. No carbonizing is done. - It is approximated that the colorants fixate to 75% on the fiber. This assumption only affected the weight of the fabric here, since the fate of the chemicals was not followed.'' ''Truck from Swedish wet treatment plant back to weaving mill The distance was assumed to 30 km.'' ''Truck from Swedish weaving mill to upholstery plant The distance was assumed to 500 km.'' ''Truck from user to incineration plant The distance to the incineration plant was assumed to 25 km.''

Allocations	''The allocation procedure by mass was not uniform in applications. The deviations were as follows: - No flows were allocated to waste, such as edge strips from weaving or cardboard or textile samples. - Wool was allocated 40% to wool and 60% to meat (economic allocation). - In the weaving operation, allocation was made per meter fabric. - Allocations for light fuel oil, heavy fuel oil, LPG and natural gas production were not known as well as for electricity from natural gas or oil and production of sodium hydroxide and ethylene glycol used for the sensitivity analysis. - For electricity production (Swedish average) the allocation between recycling and virgin materials was according to the 50/50 method. When heat was also produced, the allocation was according to energy output. - For electricity (European average), exergy values were used to allocate between electricity and heat.'' ''Sheep farming in New Zealand In Ellebäk Laursen et al (1997) 40% of the environmental impact from sheep was allocated to wool and this allocation was also made in this ESA-report. This estimate is based on a global estimation that in most countries sheep are held for meat production with the important exception Australia where sheep are held mainly for wool. Sheep give about 4.5-5 kg fleece/year (Ellebäk Laursen et al (1997)). It is fairly clear that Ellebäk Laursen et al mean raw wool with oddments when giving data for ''raw wool'' . On the assumption that Ellebäk Laursen et al mean wool including oddments, oddments were assumed to have the same environmental impact per kg as first quality raw wool, and also in this case study this is assumed since it can be assumed that wool with oddments can replace first quality wool in some applications.''
Systems Expansions	''In the life cycle of the wool/PA fabric 1.03 kg grease and 2.87 kg wool oddments (stained wool) are also generated, but are not outputs here because their benefits are calculated (system expansion).''

About Inventory

Publication	Dahllöf L, 2004, Methodological issues in the LCA procedure for the textile sector - a case study concerning fabrics for a sofa. Environmental Systems Analysis report 2004:7, Chalmers University of Technology, Gothenburg, Sweden http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2004-7.pdf
Intended User	LCA and textile practitioner
General Purpose	Part of doctoral studies. ''The overall purpose of the studies is to give suggestions for solving some of the methodological issues within the LCA method when used in the field of textiles.''
Detailed Purpose	''The goal of this case study was to identify, map and discuss LCA methodological issues in the textile sector. This was done by carrying out an LCA study with the goal of ranking three fabric types for a sofa. i) The main reason for carrying out the study was that the LCA methodology is not fully developed and different sectors have different method development needs. This work was being done on the basis of interest from the textile industry in Sweden. ii) The study could be used for further development regarding methodological issues in the efforts

	to establish Product Specific Rules (PSRs) for Certified Environmental Declarations (EPDs) in the textile sector (the Swedish Environmental Management Council 2000) and for the modification work of the ISO 14040 (1997) - ISO 14043 (2000) standards. iii) It is intended to be used by purchasers, designers, etc., in the textile industry as well as for researchers and others working with the ISO 14040 (1997) - ISO 14043 (2000) standards.''
Commissioner	Stiftelsen Svensk Textilforskning - .
Practitioner	Lisbeth Dahllöf - .
Reviewer	Maria Walenius Henriksson - IFP Research AB
Applicability	For applicability for the process see 'Technical System' and 'System Boundaries' above.
About Data	'' Wool scouring, combing, shrink proofing, effluent treatment at Bremer Woll-Kämmerei AG (BWK) Air emissions come from evaporation, incineration and the coal-fired plant. Data reported are from the total amount. It is calculated on the basis of energy demand and that wool is responsible for 90% of these emissions.'' ''Production of polyamide 66 (nylon). Data source: average production data in Europe. The data are a weighted average based on production volume from 7 different plants in Germany, Austria and the Netherlands (about 30% of total European production). The amount of packaging was estimated in this LCA study.'' ''Spinning of wool yarn Data came from one spinning mill. Worsted spinning system data for the dimension of Nm 36/2 was reported, since this is what the representatives from the weaving mills state they often use for upholstery qualities. The representative from the spinning mill also claimed that this is the standard type of yarn for upholstery fabrics. The activities included are: preparation, ring spinning, rinsing, and twisting of worsted Nm 36/2 yarn. Energy consumption for light and air conditioning was included. Water consumption was not reported, and is therefore not included here. The data for packaging material come from one weaving mill. All energy was assumed to be electricity.'' ''Dyeing of wool fabric including pretreatment, rinsing and drying - Data for energy (not specified) and BOD, came from Ellebäk Laursen et al (1997). The range for energy use is reported there to 3.40-13.2 MJ/kg textile (Dyeing/washing/drying) and 4.05-8.00 MJ/kg textiles for finishing. - BOD for scouring: 47 g/kg textile, dyeing is reported to 9-34 g/kg textile and finishing 2-80 g/kg textile according to Ellebäk Laursen et al (1997). There was no finishing of the fabric. - The formulation for dyeing is an average of data from one wet treatment mill and a standard formulation from Clariant Sweden (2001). Data were for a dark red color. - The dyer used a machine for dyeing called THEN Soft Stream, a kind of HT machine. - Owing to poor data, general water and energy use were not included. - Data for water consumption are a combination of the wet treatment mill, data for cotton fabrics rinsing and data from Ellebäk Laursen et al (1997). - It is approximated that the colorants fixate to 75% on the fiber. This assumption only affected the weight of the fabric here, since the fate of the chemicals was not followed. - Data for non-elementary discharges to water of metals were not known. - The packaging is cardboard rolls. PE that is wrapped over was assumed to insignificant. - Surfactant for the washing was not included, owing to absence of data.'' ''Dry-cleaning - Data from Österlund B (2002). The chemicals reported end up in a destruction plant (e.g. incineration). Much more solvent is used, but it is distilled and reused, therefore it is not added as a new chemical for each dry-cleaning. Distillation energy and general energy were included.'' ____ ESA Database Project. Years: 2009-2011. Administering organisation: Chalmers University of Technology, the department of Environmental Systems Analysis. Financier: The Swedish Research Council. Importer of data: Filippa Fuhrman (ESA), assisted by Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
Notes	The original publication includes more information about data. ''The studies are being carried out at the Environmental Systems Analysis Department at Chalmers University of Technology in Gothenburg, Sweden and are being financed mainly by Stiftelsen Svensk Textilforskning and CPM, Centre for Environmental Assessment of Product and Material Systems.''
